CONTENTS

	Preface	*page* xi
1	**Introductory neuroanatomy and neurophysiology: the properties of motoneurons**	1
1.1	The central nervous system	1
1.2	Introductory anatomy of motoneurons	5
1.3	Fine structure: synaptic covering	8
1.4	Inhibition and excitation: synaptic potentials	11
1.5	Synaptic potentials from a single synapse	16
1.6	Anatomical connections: wiring diagrams	19
1.7	Action potential of the motoneuron	25
1.8	Anatomical factors in action-potential propagation	28
1.9	Current-injection experiments	30
2	**The classical theory of membrane potentials**	33
2.1	Introduction	33
2.2	Cell-membrane and chemical constituents of the intracellular and extracellular fluids	36
2.3	The Nernst–Planck and Poisson equations	37
2.4	Solution of first-order linear differential equations	43
2.5	General solution of the Nernst–Planck and Poisson equations	44
2.6	The membrane is permeable only to ions of the same valence	45
2.7	Gibbs–Donnan equilibrium	51
2.8	Diffusion potential	54
2.9	The constant-field assumption	55
2.10	Goldman's formula for V_m	57
2.11	Applications of Goldman's formula to the calculation of membrane potentials	58
2.12	Estimation of parameters in the Goldman formula	59

Henry C. Tuckwell
Table of Contents
More information

2.13	Current–voltage relationships with constant permeabilities	63
2.14	Reversal potentials and permeability changes	66
2.15	Current–voltage relationships for nodal membrane	71
2.16	Effects of surface charges	74
2.17	Effects of active transport	80
3	**The Lapicque model of the nerve cell**	85
3.1	Introduction	85
3.2	Subthreshold response to current steps	87
3.3	Impulse response (Green's function): EPSP and IPSP	90
3.4	Subthreshold repetitive excitation	94
3.5	Strength–duration curve for constant applied current	99
3.6	Frequency of action potentials and f/I curves	104
3.7	Graphical determination of the spike train	106
3.8	Cyclic inputs	109
3.9	Laplace transforms	120
4	**Linear cable theory for nerve cylinders and dendritic trees: steady-state solutions**	124
4.1	Introduction	124
4.2	Derivation of the cable equation for nerve cylinders	125
4.3	Boundary and initial conditions	130
4.4	Dimensionless variables and typical constants	134
4.5	Steady-state cable equation	138
4.6	Second-order linear ordinary differential equations	139
4.7	Current injection at an end: steady-state solutions	141
4.8	Current injection along the cylinder: steady-state solutions using the Green's function	146
4.9	The steady-state potential over dendritic trees	154
4.10	Complete trees with input currents only at the origin or terminals	156
4.11	Complete trees with inputs along the cylinders and/or at the terminals and origin	168
4.12	Incomplete trees	178
5	**Time-dependent cable theory for nerve cylinders and dendritic trees**	180
5.1	Introduction	180
5.2	The Green's function method of solution for nerve cylinders	181
5.3	Methods of determining the Green's function	184
5.4	Response to a rectangular current wave	192

Table of Contents
More information

5.5	Response to an approximation to synaptic input current (alpha function)	198
5.6	The Green's function for various cable lengths and boundary conditions	202
5.7	Current injection at a terminal	205
5.8	Time-dependent potential over dendritic trees	209
5.9	The equivalent cylinder	218
5.10	Determining the potential over the soma–dendritic surface for arbitrary input current: the role of dendrites	223
6	**Rall's model neuron**	234
6.1	Introduction	234
6.2	The Green's function for a semiinfinite cylinder with a lumped soma at $x = 0$	237
6.3	The Green's function for a finite cylinder with a lumped soma at $x = 0$	239
6.4	Response of the finite cylinder with lumped-soma termination to a rectangular current wave	253
6.5	Response to synaptic input current	261
6.6	Modeling the subthreshold behavior of the motoneuron	268
6.7	Frequency of action potentials	278
