Cover image: The image shows a soap bubble on a rotating table. The internal reflection of light within the soap film causes variations in the thickness of the film to show up as different colors. This laboratory experiment is used to study vortices in rotating systems; the experiment can be seen as a small-scale version of a hurricane. This figure is taken with permission from the following publication: Meuel, T., Y.L. Xiong, P. Fischer, C.H. Bruneau, M. Bessafi, and H. Kellay, *Intensity of vortices: from soap bubbles to hurricanes*, Scientific Reports, 3, p3455, 2013.

Cover design by James F. Brisson
