Chapter 1 Introduction 1

The 'sixth extinction' 2
Why conserve biodiversity? 2
Endangered and extinct species 3
What is an endangered species? 5
What causes extinctions? 7
Recognition of genetic factors in conservation biology 7
What is conservation genetics? 8
Examples of the use of genetics to aid conservation 10
Genetic management of threatened species 13
Methodology in conservation genetics 15
Sources of information 15
Summary 16
General bibliography 16
Problems 17
Practical exercises: categorizing endangerment of species 18

Chapter 2 Genetics and extinction 19

Genetics and the fate of endangered species 20
Relationship between inbreeding and extinction 22
Relationship between loss of genetic diversity and extinction 28
Summary 33
Further reading 34
Software 34
Problems 34
Practical exercises: computer projections 34

SECTION 1 EVOLUTIONARY GENETICS OF NATURAL POPULATIONS 39

Chapter 3 Genetic diversity 41

Importance of genetic diversity 42
What is genetic diversity? 43
Measuring genetic diversity 46
Extent of genetic diversity 56
Low genetic diversity in threatened species and bottlenecked populations 61

Richard Frankham, Jonathan D. Ballou, David A. Briscoe and Karina H. McInnes
Table of Contents
More information

Variation over space and time 62
Genetic differences among species 63
Summary 64
Further reading 64
Software 64
Problems 65
Practical exercise: Measuring genetic diversity using microsatellites 65

Chapter 4 Characterizing genetic diversity: single loci 66

Describing genetic diversity 67
Frequencies of alleles and genotypes 67
Hardy–Weinberg equilibrium 69
Expected heterozygosity 72
Deviations from Hardy–Weinberg equilibrium 78
Extensions of the Hardy–Weinberg equilibrium 79
More than one locus: linkage disequilibrium 83
Summary 86
Further reading 87
Software 87
Problems 87

Chapter 5 Characterizing genetic diversity: quantitative variation 90

Importance of quantitative characters 91
Properties of quantitative characters 92
Basis of quantitative genetic variation 94
Methods for detecting quantitative genetic variation 94
Partitioning genetic and environmental variation 96
Partitioning of quantitative genetic variation 97
Evolutionary potential, additive variation and heritability 99
Dominance variance (V_D) 108
Measuring genetic changes over time 109
Correlations between molecular and quantitative genetic variation 110
Genotype × environment interaction 110
Summary 112
Further reading 112
Software 112
Problems 113

Chapter 6 Evolutionary impacts of natural selection in large populations 115

The need to evolve 116
Factors controlling the evolution of populations 119
Selection 121
Selection on quantitative characters 133

Summary 136
Further reading 137
Software 137
Problems 137
Practical exercises: computer simulations 138

Chapter 7 Evolutionary impacts of mutation and migration, and their interactions with selection in large populations 140

Factors controlling the evolution of populations 141
Importance of mutation and migration and their interactions with selection in conservation 141
Origin and regeneration of genetic diversity 141
Mutation 142
Mutation–selection balance and the mutation load 146
Migration 152
Migration–selection equilibria and clines 155
Summary 158
Further reading 159
Software 159
Problems 159

Chapter 8 Genetic consequences of small population sizes 161

Importance of small populations in conservation biology 162
Chance effects 163
Fixation 168
Effects of population bottlenecks 168
Inbreeding 173
Measuring population size 174
Selection in small populations 176
Mutation–selection equilibrium in small populations 177
Computer simulation 178
Summary 179
Further reading 179
Software 180
Problems 180
Practical exercises: computer simulations 180

Chapter 9 Maintenance of genetic diversity 182

Conservation of genetic diversity 183
Fate of different classes of mutations 183
Maintenance of genetic diversity in large populations 184
Neutral mutations under random genetic drift 184
Selection intensities vary among characters 188
Balancing selection 189
Reproductive fitness 198

Table of Contents
More information

Maintenance of genetic diversity in small populations 199
Summary 204
Further reading 204
Software 204
Problems 205
Practical exercises: Computer simulations 206

Chapter 10 Population genomics 207

Genome sequencing and population genomics 208
cDNA expression microarrays 210
What conservation benefits might be gained from genomics? 211
Genome organization 212
Insights into evolution from genomics 216
Insights from gene expression studies 222
Prospects for individual-locus genetic management 223
Summary 227
Further reading 227
Software 227
Problems 228

SECTION II EFFECTS OF POPULATION SIZE REDUCTION 229

Chapter 11 Loss of genetic diversity in small populations 231

Changes in genetic diversity over time 232
Relationship between loss of genetic diversity and reduced fitness 232
Effects of sustained population size restrictions on genetic diversity 234
Relationship between population size and genetic diversity in wild populations 239
Effective population size 242
Measuring effective population size 243
Gene trees and coalescence 254
Summary 257
Further reading 257
Software 257
Problems 258
Practical exercises: computer simulations 258

Chapter 12 Inbreeding 260

What is inbreeding? 261
Conservation concerns with inbreeding 262
Measuring inbreeding: inbreeding coefficient (*F*) 262
Genetic consequences of inbreeding 265

Richard Frankham, Jonathan D. Ballou, David A. Briscoe and Karina H. McInnes
Table of Contents
More information

Inbreeding in small random mating populations 269
Pedigrees 274
Regular systems of inbreeding 276
Mutation–selection balance with inbreeding 279
Inbreeding in polyploids 281
Relationships between inbreeding, heterozygosity, genetic diversity and population size 282
Summary 283
Further reading 283
Software 283
Problems 283

Chapter 13 Inbreeding depression 285

Inbreeding depression in naturally outbreeding species 286
Inbreeding depression in the wild 287
Inbreeding depression due to small population size 289
Inbreeding, population viability and extinction 290
Characteristics of inbreeding depression 293
Inbreeding depression in species that regularly inbreed 296
Genetic basis of inbreeding depression 296
Purging 299
Detecting and measuring inbreeding depression 303
Genetic rescue 306
Summary 307
Further reading 307
Software 308
Problems 308

Chapter 14 Population fragmentation 309

Habitat fragmentation 310
Population fragmentation 310
Population structure 312
Completely isolated population fragments 314
Measuring population fragmentation: *F* statistics 321
Gene flow among population fragments 325
Measuring gene flow 327
Landscape genetics 331
Impacts of different population structures on reproductive fitness 332
Summary 334
Further reading 335
Software 335
Problems 336

Chapter 15 Genetically viable populations 337

Shortage of space for threatened species 338
How large? 340
Retaining reproductive fitness 340

Table of Contents
More information

Retaining evolutionary potential 341
How large are threatened populations? 343
Long-term retention of single-locus genetic diversity 347
Time to regenerate genetic diversity 348
Avoiding accumulation of new deleterious mutations 348
Genetic goals in the management of wild populations 349
Genetic goals in management of captive populations: a compromise 351
The fallacy of small surviving populations 355
Summary 356
Further reading 356
Software 357
Problems 357

SECTION III FROM THEORY TO PRACTICE 359

Chapter 16 Resolving taxonomic uncertainties and defining management units 362

Importance of accurate taxonomy in conservation biology 363
What is a species? 366
Sub-species 369
How do species arise? 370
Delineating sympatric species 372
Delineating allopatric species 373
Genetic distance 375
Constructing phylogenetic trees 377
Outbreeding depression 381
Defining management units within species 384
Summary 387
Further reading 388
Software 388
Problems 389
Practical exercise: building a phylogenetic tree 390

Chapter 17 Genetic management of wild populations 391

Genetic issues in wild populations 392
Increasing population size 394
Diagnosing genetic problems 396
Genetic rescue of small inbred populations by outcrossing 397
Genetic management of fragmented populations 399
Genetic issues in reserve design 405
Impacts of harvesting 406
Genetic management of species that are not outbreeding diploids 407
Summary 412

Further reading 413
Software 413
Problems 413

Chapter 18 Genetic issues in introduced and invasive species 414

Impact of invasive species on biodiversity 415
Phases in establishment of invasive species 416
Genetic issues in invasion biology 417
Evolution of native species in response to introduced species 419
Control of invasive species 420
Introgression and hybridization 425
Summary 428
Further reading 428
Software 429
Problems 429

Chapter 19 Genetic management of captive populations 430

Why captive breed? 431
Stages in captive breeding and reintroduction 433
Founding captive populations 434
Growth of captive populations 437
Genetic management during the maintenance phase 437
Captive management of groups 444
Ex situ conservation of plants 446
Reproductive technology and genome resource banks 447
Managing inherited diseases in endangered species 449
Summary 451
Further reading 451
Software 451
Problems 452

Chapter 20 Genetic management for reintroduction 453

Reintroductions 454
Genetic changes in captivity that affect reintroduction success 456
Genetic adaptation to captivity 458
Genetic management of reintroductions 461
How successful are reintroductions? 464
Supportive breeding 465
Case studies in captive breeding and reintroduction 466
Summary 470
Further reading 471
Software 471
Problems 471

Table of Contents
More information

Chapter 21 Use of molecular genetics in forensics and to understand species biology 472

Forensics: detecting illegal hunting and collecting 473
Understanding a species' biology is critical to its conservation 474
Population size and demographic history 478
Gene flow and population structure 481
Reintroduction and translocation 486
Breeding systems, parentage, founder relationships and sexing 486
Disease 493
Diet 493
Aging and fitness from telomere lengths 493
Dating using molecular clocks 494
Summary 494
Further reading 495
Software 495
Problems 496

Chapter 22 The broader context: population viability analysis (PVA) 497

What causes endangerment and extinction? 498
Predicting extinction probabilities: population viability analysis (PVA) 500
Genetics and PVA 505
Insights into the causes of extinction from PVA 506
Recovering threatened populations 509
Using PVA to evaluate management options: case studies 510
How useful are the predictions of PVA? 514
Lessons learned 516
Minimum viable population sizes (MVP) 517
Summary 520
Further reading 520
Software 521
Problems 521
Practical exercises: population viability analyses 521
