Modern research demonstrates that imitation is more complex than classical theories proposed. This book provides analysis of empirical work on imitation and shows what can be learned through interdisciplinary research. Why do we imitate and what does it tell us about the encoding of self and others within our brains?

Between Culture and Biology
Perspectives on Ontogenetic Development
edited by Heidi Keller
Ype H. Poortinga and Axel Schölerich

Between Culture and Biology brings together biological, psychological and cultural perspectives on development. It argues that the biological bases of behaviour and cultural context should be approached in an integrated fashion to properly understand ontogenetic development and that both the cultural and biological domain provide constraints and opportunities for development.

Microdevelopment
Transition Processes in Development and Learning
edited by Nira Granott and Jim Parziale

Microdevelopment is the process of change in abilities, knowledge and understanding during short time-spans. This book presents a new process-orientated view of development and learning based on recent innovations in psychology research: it will be essential reading for all interested in cognitive and developmental science.

Imitation in Infancy
edited by Jacqueline Nadel and George Butterworth

This is the first book to bring together the extensive modern evidence for an innate capacity to imitate in babies, research into which has had a controversial history. Some of the world’s foremost researchers on imitation and early intellectual development review the major explanations for imitation and the purpose it may serve in normal and abnormal human development, drawing comparisons with other primate species.

Learning to Read and Write
A Cross-Linguistic Perspective
edited by Margaret Harris and Giyoo Hatano

This book brings a unique cross-linguistic perspective to our understanding of how children learn to read and write in a wide range of different languages and scripts which vary from each other in important ways. These include both Western European scripts (English, Italian, German, Greek, Portuguese and Scandinavian languages) as well as Hebrew and Chinese-based scripts.

Children’s Understanding of Biology and Health
edited by Michael Siegal and Candida Peterson

This presents a unique and fresh examination of children’s understanding of biology and health. Each of the contributors views children’s understanding in these areas to be to some extent adaptive to their well-being and survival and considers whether young children are capable of basic theorising and understanding of health and illness topics ranging from babies to the elderly.
