Index-learning turns no student pale,
Yet holds the eel of science by the tail.
Alexander Pope

adhesion approximation, 232
adiabatic decay
  in evolution of $b(t)$, 161
  and heat flow into regions, 373–4, 376–8
  of initial peculiar velocities, 391
  as universe expands, 269, 276, 416–21

bank robbers, 141
Bayes's theorem, 250–1
BBGKY hierarchy
  derived from Liouville's equation, 205–7
  growth of two-particle correlations in, 207–15
  scaling in, 218–19
Bentley, Richard, 11–12
bias, 131, 221–3, 355–61, 447–9
bulk velocity flow
  effects on peculiar velocity distribution functions, 452–8
  nature of, 166–7
  produced by dark matter, 476

Cantor's set, 91–2
catalogs of galaxies
  Abell, 49–50, 90
  Herschel, J., 22, 23
  Herschel, W., 17–22
  Hubble, 27–8
  Lick, 28, 53
  Messier, 17
  modern, 135, 242–5, 430–45, 453
  Shapley, 28
  Zwicky, 50, 162–3, 430
clusters of galaxies
  Abell, clustering of, 449–50
  binding of, 100–2
  controversy over uniformity, 27–31, 50–1
  correlations of, 51, 135
  discoveries of, 17, 18, 22, 25, 49–50
  evolution of b for, 381–5
  multiplicity function, 361–4, 378–81
  Neyman-Scott models, 41–2, 363–4
  observed properties, 107–12
  probability for finding, 460–2
  physical processes in, 112–20
  Pisces-Perseus, 442–6, 460–2
  topology of Abell cluster distribution, 90
comoving equations of particle motion, 182, 228, 268–72, 307, 315–6
comoving potential, 306–8, 315
conditional and unconditional density, 121–2
confusion, utter, 279
correlation dimension, 98–9
correlation energy, 147, 224, 270, 286, 310–11
correlation functions, 65–6, 121–40
  angular, 130–1, 133–4
  BBGKY hierarchy growth, 207–15
  bias, 131, 221–3
  of clusters, 135–6
  and distribution functions, 262–3
  in Einstein–de Sitter model, 185
  evolution of, 171–215, 381–5
  and fluctuations, 126, 131, 321–2
  for GQED, 353–4, 372
  higher order, 127, 128
  magnitude scaling, 131
  normalization of, 126–8
  observation of, 133–6, 242–5
  in redshift space, 130, 135, 219–21
  see also two-point correlations
cosmic blackbody background, 51
cosmic energy equation, 225
  conditions for validity, 271
  derivation from adiabatic evolution, 374–5

More information

cosmic energy equation (*cont.*)
derivation from comoving Hamiltonian, 271–2
derivation from equations of motion, 268–71
derivation from gravitational equation of state, 272–3
and evolving distribution functions, 273–7
timescale for macroscopic changes, 317
cosmology, *see* Einstein–Friedmann models
cosmogony myths, 3–10
classification of, 3–4
Greek views of Universe, 7–10
various, 4–7
counts-in-cells, *see* distribution functions
criticality, self-organized, 334

dark matter, 141, 146–7
dynamical estimates, 100–102
effect on clustering, 241–2, 413–15
effects on velocity distributions, 473–6
problems fitting counts in cells, 439–42
and x-ray emission, 101, 103, 109
dimensions of fractals, 83, 92–6
dissipation
dynamical, 113
as universe evolves, 477–9
distribution functions, 141–68
binomial, 260, 351
characteristic function, 257–8
compounded, 259–61, 357
conditional, 250–1
and correlation functions, 262–3, 264–7
counts in cells, 333
cumulants, 253–4
dark matter models, 413–15, 439–41, 473–6
definition, 142, 249–51
evolution, 152–3, 159, 161, 264–7, 273–7, 372–85, 407–15, 459–62
fluctuations related to correlation integrals, 265
form of $b(\bar{n}, T)$, 319–26
fractal dimensions of, 97–9
generating functions, 254–8, 264–7, 348–53
graphs of GQED, 151–3, 337–42, 370–1
gravitational quasi-equilibrium, 149–50, 329–32, 333–65, 389–425
Hubble's analysis, 28–31
infinite divisibility, 261–2
limiting cases of GQED, 334–5
lognormal, 30, 31
merging and, 465–72
moments of, 251–3, 255
of multiplets, 262
nearest neighbor statistics, 150–1, 333, 336, 339–40, 403, 436–7
negative binomial, 324
from non-Poisson initial conditions, 411–13
normalization of GQED, 335–6
observed, 160–8, 429–62
observed scaling with magnitude, 442
scale dependence of b, 403–8
simulations, 154–63, 389–415
sums of, 357
of sums, 258
velocity, 150–3, 157–60, 163–7, 366–71, 416–25, 452–8
see also velocity distributions, Poisson distribution
dynamical attractor, 273–7

Einstein–Friedmann models
adiabatic parameter, 373–4
fate of, 479–83
growth of linear perturbations in, 179–94, 381–5, 408–11
history of, 33
Newtonian analogue, 137–8
properties and evolution of, 173–9, 191
ensembles, 294–7, 310–11, 321, 329
entropy
and adiabaticity, 373–7
coarse grained, 200–2
of correlations, 202–5
evolution, 324, 378
fundamental equations, 279, 281, 288
gravitational quasi-equilibrium, 327–8
of perfect gas, 287
and Second Law of thermodynamics, 292–3
in 6N-dimensional phase space, 200
