Joel H. Ferziger – Obituary xxi

PART I ON THE PHYSICS OF TURBULENCE 1

1 Prologue 3

2 Turbulence: its origins and structure 4
2.1 Introduction: the nature of turbulence 4
2.2 Laminar–turbulent transition 5
2.3 Fully turbulent flows 9
2.4 Energy transfer in turbulent flows 12

3 A novel two-equation turbulence closure for high Reynolds numbers. Part A: homogeneous stratified shear layers 14
3.1 Introduction 14
3.2 Scales and variables for a novel approach 16
3.3 Structural equilibrium 16
3.4 The role of buoyancy and the term $\mathcal{B}$ 17
3.5 Regimes of stratified turbulence 18
3.6 Dynamic completion of the collapse 19
3.7 Consequences of the new closure 20
3.8 Discussion 27
3.9 Summary 29

4 A novel two-equation turbulence closure for high Reynolds numbers. Part B: spatially non-uniform turbulence 31
4.1 Introduction 31
4.2 Conservation laws and balances 31
4.3 Stratification and the novel closure 33
4.4 Eddy-viscosity closures and their limitations 33
4.5 Spatial inhomogeneity and other closures 34
4.6 Selected applications and tests 34
4.7 Homogeneous layers in the k–Ω system 39
4.8 Summary 41
4.9 Notations used in Chapters 3 and 4 43

Table of Contents
More information

5 On some analogies between high-Reynolds-number turbulence and a vortex gas for a simple flow configuration 44
5.1 Introduction 44
5.2 Vortices 44
5.3 Vorticons 45
5.4 Vorticon–vorticon interactions 46
5.5 Mixing of scalars and momentum 47
5.6 Shear-free, non-stratified turbulence 47
5.7 Some correspondence relations 49
5.8 Summary 51

6 A spectral-closure model for turbulent flows with stable stratification 53
6.1 Introduction 53
6.2 From Navier–Stokes to Langevin 53
6.3 A formal procedure for successive elimination of small scales 55
6.4 Eddy viscosities and diffusivities 58
6.5 The dispersion relation of internal waves and the threshold of wave generation in the presence of turbulence 59
6.6 The spectrum of the total energy 60
6.7 The horizontal energy spectrum as a function of the vertical wavenumber 61
6.8 The vertical energy spectrum as a function of the horizontal wavenumber 61
6.9 Application for modeling of turbulent shear flows 62
6.10 Summary 64
6.11 Appendix. Asymptotic values of the coefficients R_1–R_4 in cases of weak and strong stratification 65

7 Intermittency 66
7.1 Introduction 66
7.2 What is intermittency? 67
7.3 The Richardson cascade, Kolmogorov's law, and intermittency 68
7.4 Discrete cascade models 69
7.5 Continuous cascade models 75
7.6 Conclusions 78

8 Horizontal mixing processes 79
8.1 Introduction 79
8.2 Observations and relations 79
8.3 Relative eddy-diffusion laws 81

9 Epilogue 84

PART II OBSERVATIONAL METHODS

10 Prologue 87

11 Horizontal and vertical turbulence profilers 89
11.1 Introduction 89
11.2 Basic requirements 91
11.3 Examples 92

12 Microstructure sensors 101
12.1 Sensor requirements 101
12.2 Technical effort, cross sensitivities, and handling 101
12.3 Dissipation from shear and temperature 102
12.4 Sensors for microstructure measurements 103
12.5 Thermistor-based temperature microstructure sensors 105
12.6 Velocity shear sensors 106

13 Optical sensors 110
13.1 A description of the microstructure optical probe 110
13.2 An example of a fluorescence profile 112

14 Dissipation measurement: theory 115
14.1 The viscous dissipation rate 115
14.2 The diffusive dissipation rate 117
14.3 The Thorpe scale 119
14.4 Practical processing of velocity shear data 120
14.5 Temperature-gradient data 125

15 Acoustic Doppler techniques 127
15.1 Introduction 127
15.2 Point measurements of turbulence near the seabed 127
15.3 The measurement of turbulence through the water column using acoustic Doppler methods 128
15.4 Shear stress and TKE production from the variance method 131
15.5 Dissipation estimates from a vertical-beam ADCP 135
15.6 Recent and future developments 136
15.7 Summary 137

16 Validation of microstructure-based diffusivity estimates using tracers in lakes and oceans 139
16.1 Introduction 139
16.2 The Lake Alpnach study 139
16.3 The South Baikal turbulence study 144

Table of Contents
More information

16.4 Ocean studies 146
16.5 Summary 152

17 Other methods and approaches 153
17.1 Particle-imaging velocimetry 153
17.2 Hot-film anemometry 153

18 Epilogue 155

PART III NUMERICAL AND COMPUTATIONAL METHODS

19 Prologue 00

20 Direct and large-eddy simulation of turbulence 160
20.1 Introduction 160
20.2 Approaches to predicting turbulent flows 161
20.3 The basis of LES: filtering 163
20.4 Subgrid-scale modeling 164
20.5 Effects of extra strains 173
20.6 Wall models 174
20.7 Numerical methods 176
20.8 Accomplishments and prospects 179
20.9 Summary and conclusions 181

21 Marine-turbulence modeling using data assimilation 182
21.1 Introduction 182
21.2 Coastal circulation as an inverse modeling problem 183
21.3 Data assimilation for marine-turbulence modeling 184

22 A generic transport equation for the length scale in turbulent flows 188
22.1 Introduction 188
22.2 The generic equation 188
22.3 Inhomogeneous shear-free turbulence 191
22.4 The performance of traditional two-equation models 192
22.5 Summary and conclusions 195

23 Some numerical aspects of turbulence-closure models 197
23.1 Introduction 197
23.2 Positivity preservation 197
23.3 Energy conservation 199
23.4 Treatment of boundary conditions 202
23.5 Summary and conclusions 205

24 How to do random walk right in eddy-viscosity models 207
24.1 Introduction 207
24.2 From Lagrangian to Eulerian 207
24.3 Random-walk schemes 208
24.4 Random walk with a second-order turbulence-closure model 211
24.5 Summary and conclusions 212

25 The GOTM modeling system 213
25.1 Physical concepts of the GOTM 213
25.2 Selected results of the GOTM for oceanic and limnic applications 215
25.3 Summary and conclusions 223

26 Coupling of the GOTM turbulence module to some three-dimensional ocean models 225
26.1 Introduction 225
26.2 Interfacing between hydrodynamic and GOTM turbulence modules 225
26.3 The MOM applied to the Mediterranean Sea 225
26.4 The MOHID applied to the Iberian west coast 229
26.5 The GETM applied to the Wadden Sea 231
26.6 Summary and conclusions 236

27 Epilogue 238

PART IV BOUNDARY LAYERS 241

28 Prologue 243

29 The surface mixed layer: an overview 244
29.1 Introduction 244
29.2 Characteristics 244
29.3 Air–sea fluxes 246
29.4 angmuir cells 247
29.5 Deep convection 248
29.6 Numerical models 248
29.7 Summary and conclusions 249

30 The near-surface boundary layer 250
30.1 The air–sea skin effect, gradients, and fluxes under low-wind conditions 250
30.2 Periodic transfer processes near the air/sea interface under high-wind conditions 260
30.3 Summary and conclusions 271

Table of Contents
More information

31 Modeling turbulence generation by breaking waves 273
31.1 Introduction 273
31.2 Theory 273
31.3 Observation and analysis 274
31.4 Other recent data comparisons 274
31.5 Further theoretical considerations 275
31.6 Summary and conclusions 276

32 Langmuir circulation 277
32.1 Introduction 277
32.2 Examples from LES 278
32.3 Parameterization issues 280
32.4 Summary and conclusions 282

33 Near-bottom boundary layers 283
33.1 Steady and oscillating boundary layers 283
33.2 Wave–current interaction 288
33.3 Effects of sediment 290
33.4 Summary and conclusions 296

34 Equatorial turbulence 297
34.1 Introduction 297
34.2 A LES model 297
34.3 Effects of the horizontal component of the Earth's rotation 299
34.4 The diurnal cycle 300
34.5 The effect of the EUC on turbulence and waves 302
34.6 The mechanism of the deep-cycle turbulence 305
34.7 Diurnal rectification 306
34.8 Summary and conclusions 306

35 The effect of rotation on convective boundary-layer turbulence 308
35.1 Introduction 308
35.2 Analysis of turbulence structure and second-moment budgets 308
35.3 Modeling pressure–potential-temperature covariance 310
35.4 Summary and conclusions 312

36 Epilogue 314

PART V ESTUARIES, FJORDS, AND LAKES 315

37 Prologue 317

38 Turbulence in a swift tidal channel with weak stratification 318
38.1 Introduction 318
38.2 The experiment 318
38.3 Flow and turbulence characteristics 318
38.4 Testing the parameterization of TKE dissipation 320
38.5 Summary 323

39 Partially mixed estuaries: the Hudson River 324
39.1 Introduction 324
39.2 Tidal, fortnightly, and longer-term variability 325
39.3 Notes on some other estuaries 328
39.4 Turbulence-closure simulation 330
39.5 Summary 332

40 Turbulence measurements in highly stratified estuaries 334
40.1 Introduction 334
40.2 Mixing processes in strongly stratified systems 335
40.3 Observations of turbulence and mixing 335
40.4 Microstructure observations of turbulent diffusion 337
40.5 Summary 338

41 Turbulence measurements in fjords 340
41.1 Introduction 340
41.2 Fjord circulation 340
41.3 Convective renewal 340
41.4 Sill processes 341
41.5 Diffusive conditioning 343
41.6 Summary 344

42 Turbulence and mixing regimes specific to lakes 346
42.1 Introduction 346
42.2 The surface boundary layer 346
42.3 The bottom boundary layer 348
42.4 Mixing in the interior 351
42.5 Summary 353

43 Epilogue 355

PART VI SHELF SEAS AND THE SHELF EDGE 357

44 Prologue 359

45 The near-shore region 361
45.1 Introduction 361
45.2 Boundary layers below large-scale flows 361
45.3 Waves – parameterized 363

Table of Contents
More information

45.4 Waves – individual and effects of shape 365
45.5 Sediments 366
45.6 Bedforms 367

46 The four shelf-sea regimes 369
46.1 Introduction: the northwest European shelf seas 369
46.2 The mixed water column 369
46.3 The thermally stratified water column 370
46.4 The doubly stratified regime: turbulence closures for an OGCM of the Baltic Sea 374
46.5 The ROFI regime 374

47 The doubly stratified regime: turbulence closures for an OGCM of the Baltic Sea 376
47.1 Introduction 376
47.2 The ocean circulation model 378
47.3 The standard k–ε model 378
47.4 Results of the standard k–ε model 379
47.5 Results of sensitivity experiments 379
47.6 Discussion and conclusions 381

48 The shelf edge: internal waves 383
48.1 Internal-wave generation and energy 383
48.2 Shelf-edge examples: west of Scotland, northwest of Iberia, and northeast of America 385
48.3 Other topographic features: banks, seamounts, and canyons 388
48.4 Laboratory and model studies of internal waves and mixing over a slope 389
48.5 Boundary and oceanic mixing 389
48.6 Sediment movement 390
48.7 Shelf-edge turbulence 390

49 Epilogue 391

PART VII LARGE-SCALE PROCESSES 393

50 Prologue 395

51 Routes to dissipation in the ocean: the two-dimensional/three-dimensional turbulence conundrum 397
51.1 Introduction and overview 397
51.2 The inertia–gravity-wave route 400
51.3 The instability route 402
51.4 The boundary route 404
51.5 Summary 405

52 From mixing to geostrophy: geostrophic turbulence in atmospheres, oceans, and the laboratory 406
52.1 Introduction 406
52.2 Parameters and scales 407
52.3 Geostrophic turbulence: theory and idealized models 409
52.4 Observed spectra of two-dimensional and geostrophic turbulence 414
52.5 Summary and conclusions 421

53 Geostrophic eddies: an overview of their effects and parameterizations in ocean models
53.1 Introduction
53.2 The need for eddy parameterizations
53.3 The eddy-closure problem 425
53.4 A closer look at geostrophic eddies 428
53.5 Eddy schemes: formulation and properties 434
53.6 The impact of tracer parameterizations in ocean climate models 440
53.7 Discussion and directions for future research 442

54 Vortex dynamics and turbulent lateral heat transport 444
54.1 General introduction 444
54.2 Basic equations and the vortex-dynamics model 445
54.3 Basic regimes: splitting and confinement 447
54.4 Theory 448
54.5 Numerical experiments 451
54.6 External scaling and spreading of chimneys in the ocean 453
54.7 The problem of parameterization of eddy heat flux 455
54.8 Perspectives of the heton idealization and future work 456
54.9 Summary and conclusions 457

55 Subgrid- and supergrid-scale parameterization of turbulence in quasi-two-dimensional barotropic flows and phenomenon of negative viscosity 458
55.1 Introduction: large-scale flows with inverse energy cascade 458
55.2 The SGS representation 459

Edited by Helmut Z. Baumert, John Simpson and Jurgen Sundermann
Table of Contents
More information

55.3 Basic problems of SGS representation of two-dimensional flows in the energy range 459
55.4 Two-parameter viscosity 460
55.5 Stabilized negative viscosity 461
55.6 The SPGS representation 464
55.7 Formulation of the two-parameter SPGS representation for two-dimensional turbulence 465
55.8 The DNS of two-dimensional turbulence with two-parameter large-scale drag 467
55.9 Summary 469

56 Energy spectra and zonal flows on the β-plane, on a rotating sphere, and on giant planets 472
56.1 Introduction 472
56.2 Beta-plane turbulence 473
56.3 Scaling laws of β-plane turbulence 473
56.4 Simulation of β-plane turbulence 474
56.5 Turbulence and zonal jets on the surface of a rotating sphere 481
56.6 Characterization of spectral anisotropy 484
56.7 Anisotropic two-dimensional turbulence in the steady state 487
56.8 Zonal jets on giant planets 489
56.9 Summary 493

57 Vortex dynamics and β-plane turbulence 494
57.1 Introduction and basic problems 494
57.2 Governing equations 495
57.3 The phenomenon of β-plane turbulent jets 495
57.4 Conceptual physics of vortex models of β-plane turbulent jets 498
57.5 Basic models 499
57.6 Scaling through coherent structures 506
57.7 Singularities of mean vorticity profiles and energy spectra 507
57.8 Summary and unsolved problems 508

58 On the role of eddy mixing in the transport of zonal ocean currents 511
58.1 Introduction 511
58.2 Mixing–transport relations in flat-bottom oceans 513
58.3 A general transport theory 522

59 Passive scalars in two-dimensional and quasi-geostrophic turbulence 530
59.1 Basic concepts 530
59.2 Experiments on passive scalars 534
59.3 Theoretical and numerical modeling of passive-scalar dynamics 536
59.4 Summary 543

60 Epilogue 544

PART VIII THE CD-ROM: DATA SETS AND NUMERICAL CODES 547

61 Prologue 549

62 Model codes 551
62.1 The GOTM 551
62.2 The PROWQM 555

63 Data sets 559
63.1 Turbulence proxies: “non-turbulent” data sets 559
63.2 Turbulence data of convective cooling 561
63.3 Equatorial turbulence measurements 567
63.4 Turbulence measurements in shelf and coastal areas 567

64 Epilogue 582
