Chris Leadbetter, Stewart Wainwright and Alan Stinchcombe

Cambridge IGCSE Computer Studies Coursebook

Completely Cambridge – Cambridge resources for Cambridge qualifications
Cambridge University Press works closely with University of Cambridge International Examinations (CIE) as parts of the University of Cambridge. We enable thousands of students to pass their CIE Exams by providing comprehensive, high-quality, endorsed resources.

## Contents

**Introduction**  
v

**Part I: Theoretical concepts**

1. **Generic application software**  
   - Introduction  
   - Word processing and desktop publishing programs  
   - Spreadsheets  
   - Databases  
   - Communication programs  
   - Web authoring software  
   - Web browsers  
   - Search engines  
   - Graphics editing programs  
   - CAD/CAM programs  
   - Multimedia programs  
   - Data-logging  
   - Programming  
   - Customising generic application programs  
   - Bespoke software  
   - Examination practice for Paper 1  
   - Examination practice for Paper 3  

2. **Data**  
   - Data and information  
   - Data collection  
   - Data preparation  
   - Analogue-to-digital converters and digital-to-analogue converters  
   - Data capture and checking  
   - File organisation and manipulation  
   - File maintenance  
   - Data types  
   - Examination practice for Paper 1  

3. **Hardware**  
   - Main hardware components of a general-purpose computer  
   - Computers and processing power  
   - Input devices and their uses  
   - Output devices and their uses  
   - Specialised input and output devices  
   - Internal memory and storage devices and their uses  
   - Mobile phones  
   - Examination practice for Paper 1  
   - Examination practice for Paper 3  

4. **Systems and communications**  
   - Operating systems  
   - Types of operating system  
   - User interface  
   - File management  
   - Peripheral device control  
   - Examination practice for Paper 1  
   - Examination practice for Paper 3  

5. **Types of computer system**  
   - Batch processing systems  
   - Interactive systems  
   - Network systems  
   - Control systems  
   - Automated systems  
   - Multimedia systems and applications  
   - Examination practice for Paper 1  
   - Examination practice for Paper 3  

6. **The system life cycle**  
   - Overview  
   - Defining the problem  
   - Fact finding  
   - Feasibility study  
   - Analysis stage  
   - Design stage  
   - Building and testing stage  
   - Documentation  
   - Implementation (changeover) stage  
   - Evaluation stage  
   - Maintenance

Contents

Examination practice for Paper 1 146
Examination practice for Paper 3 147

Part II: Uses and implications

7. Range and scope of computer applications 150
   Introduction 150
   Communication systems 150
   Information systems 158
   Library systems 163
   Office automation 165
   Commercial and general data processing 166
   Industrial, technical and scientific uses 173
   Monitoring and control systems 179
   Automation and robotics 185
   Expert systems 194
   Education, training and entertainment 198
   Use of the Internet 203
   Examination practice for Paper 1 212
   Examination practice for Paper 3 215

8. Social and economic implications of the use of computers 216
   Introduction 216
   Changing employment 217
   Privacy and integrity of data 221
   Security and reliability of data 223
   Data protection legislation 224
   Computer crime 225
   Computer viruses 227
   Internet security 230
   Recent developments in the use of the Internet 232
   Examination practice for Paper 1 237
   Examination practice for Paper 3 238

Part III: Problem solving with programs and logic gates

9. Algorithm planning and design 240
   Creating a plan 240
   Understand the problem 240

Create a solution 240
Document the solution 243
Testing and interpreting algorithms 247
Examination practice for Paper 1 252
Examination practice for Paper 3 254

10. Programs and pseudocode algorithms 255
    The concept of a program 255
    Programming languages 256
    Pseudocode 260
    Producing algorithms in pseudocode 265
    Testing and interpreting pseudocode algorithms 266
    Examination practice for Paper 1 271
    Examination practice for Paper 3 273

11. Logic gates and circuits 274
    Logic gates 274
    Truth tables 276
    Combinational logic circuits with two inputs 277
    Combinational logic circuits with three inputs 278
    Designing simple logic circuits 279
    Testing logic circuits 280
    Examination practice for Paper 1 282

Appendix A – Paper 3 scenario 284
   Description of the existing system 284
   Description of the proposed computer-based system 284

Answers to SAQs 285
Glossary 291
Index 300
Acknowledgements 305
Terms and conditions of use for the CD-ROM 306
Welcome to the new, full-colour *Cambridge IGCSE Computer Studies*. Like its companion volume, *Cambridge IGCSE ICT*, this book has evolved from *IGCSE and O Level: Computer Studies and Information Technology*. While drawing on many of the topics in the parent book that are relevant to Computer Studies, this new text has been extensively revised and considerably enlarged, for two main reasons:

- to focus clearly on the *Cambridge Local Examinations Syndicate* IGCSE examination in Computer Studies (syllabus 0420) including the exam board's latest house style for presenting pseudocode and logic gates in exam papers;
- to update the content with recent developments in computer technology and its effects on our lives.

In making these changes, we have:

- ensured that explanations are as accessible as possible to students and included a Glossary at the end of the coursebook, which gives definitions for all the key terms presented in bold type in the text;
- included practical examples of the devices, processes and methods being explained;
- included brand-new short, self-assessment questions throughout the text;
- revised and updated the questions for individual work and class discussion;
- refreshed the design, making full use of colour and photographs where possible;
- created a brand-new CD-ROM, loaded with materials to improve your chances in the examination.

The coursebook is designed to help students studying for the *Cambridge Local Examinations Syndicate* IGCSE examination in Computer Studies (syllabus 0420). It provides support for: the compulsory question paper, Paper 1, syllabus Sections 1–5; the coursework, Paper 2; and the alternative to coursework question paper, Paper 3, syllabus Section 6. On the CD-ROM, we have supplied material for revision of the coursebook material and further support with exemplar answers and our examiner's comments for tackling Papers 1, 2 and 3.

We have divided the coursebook into three parts:

- Part I deals with the theory of computer technology,
- Part II deals with applications of the technology and
- Part III deals with programming and logic gates. Each chapter begins with a list of learning objectives (headed ‘When you have finished this chapter you will be able to’), which is intended to provide a skeleton upon which to hang the detail provided in the text. Also, each chapter ends with a summary of the specific points that have been covered, which is intended to assist students when they revise, by providing a short overview of the contents to allow students to be confident in their grasp of the material.

Throughout each chapter, specific syllabus codes alongside subheadings show which sections of the syllabus are being addressed, as follows:

```
4.2.1
```

The text aims to encourage an active learning style and includes many self-assessment questions as well as varied longer-answer questions and tasks, while maintaining a structured approach to the learning process.

Self-assessment questions require short answers only, and are intended to allow students to check their understanding of the material as they move through the coursebook. Answers to these questions are provided at the end of the coursebook. The self-assessment questions are indicated in the text by a box with an icon like this:
Longer-answer questions are of two types. These questions are contained in a purple box labelled 'Questions', as follows:

It must be stressed that this work is not an integral part of the syllabus requirements and can be omitted without prejudicing attainment in the examination. These materials are contained in a green box, labelled 'Extension', like this:

Some questions are related directly to the requirements that students will find when they sit their examination. These questions are intended to stretch the students more than the SAQs do, and let them demonstrate their understanding of the concepts being taught. These questions are related to the text and are intended to form a starting point for activity in class or for individual work. They are indicated in the text by an icon like this:

Other questions are more broadly based and are intended to encourage the students to find out about a small area of the course, and are often suitable for classroom discussion as well as independent thinking. We find this type of work to be especially effective because it allows students to formulate their own answers – there is often no single right answer to the question. These questions are indicated with an icon like this:

Finally, there are extension questions and tasks. These include concepts, examples or thinking that fall beyond the strict boundaries of the syllabus. However, addressing these questions will nevertheless deepen students' understanding of and appreciation for the concepts being presented. Each of these pieces of work is meant as a starting point which may interest students, particularly the more able, and encourage them to do some independent enquiry into a topic.
