PART 1. THE MATHEMATICAL FOUNDATIONS OF FINITE STRAIN THEORY 1

1. Introduction 3

2. Mathematical description of homogeneous deformations 8
2.1. The description of deformations 8
2.2. The transformation of a volume element 13
2.3. The transformation of a surface element 15
2.4. Homogeneous transformations, rigid rotations and a unique factorisation of $\boldsymbol{D}$ 17
2.5. A note on eigenvectors of matrices 25
Summary of important equations 27
Examples 28

3. Infinitesimal deformations 31
3.1. Infinitesimal transformations 31
Summary of important equations 33
Examples 34

4. Transformations describing deformations of a material medium 36
4.1. Coherent transformations 36
4.2. Incoherent transformations 40
Summary of important equations 41
Examples 42

5. Forces 44
5.1. The stress vector 44
5.2. The stress tensor 48
5.3. Symmetry of the stress tensor $\boldsymbol{\Theta}$ 53
5.4. The equation of motion 55
Summary of important equations 57
Examples 58

6. Boundary conditions and work 59
6.1. Boundary conditions 60
6.2. Virtual work 62
6.3. The principle of virtual work 64
6.4. Alternative stress tensors 65
6.5. Infinitesimal strain theory and stress tensors 70
6.6. Virtual work when $\boldsymbol{\Theta}$ is not symmetric 72
Summary of important equations 72
Examples 74

7. Another unique factorisation of $\boldsymbol{D}$ 77
7.1. The unique factorisation of $\boldsymbol{D}$ into an orthogonal matrix $\boldsymbol{V}$ and a triangular matrix $\boldsymbol{H}$ with positive diagonal elements 77
7.2. How to factorise $\boldsymbol{D}$ analytically 81
7.3. $\boldsymbol{\eta}$ and $\boldsymbol{H}$, and the infinitesimal case 82
7.4. Group properties of $\boldsymbol{D}$, and factorisation of a general transformation into a product of elementary transformations 84
Summary of important equations 85
Examples 86

8. Virtual work 87
8.1. Virtual work 87
8.2. Expression of d′w in terms of d$\boldsymbol{H}$ 88
8.3. Other strain co-ordinates 91
Summary of important equations 93
Examples 94

9. Transformation of cartesian tensors 95
9.1. Cartesian tensors 95
9.2. Examples of transformations 97
9.3. Symmetry operations 99
Summary of important equations 101
Examples 102

PART 2. NON-HYDROSTATIC THERMODYNAMICS 103

10. The thermodynamic basis
10.1. The fundamental thermodynamic assumption 105
10.2. The thermodynamic variables for homogeneous deformations 107

Summary of important equations 109
Examples 109

11. Thermodynamic relations 110
11.1. Thermodynamic relations in hydrostatics 110
11.2. Jacobians for non-hydrostatics 114
11.3. Thermodynamic relations for non-hydrostatics 115
11.4. Multivariate thermodynamics 121
Summary of important equations 121
Examples 123

12. Thermodynamic functions, equations of state 125
12.1. Thermodynamic functions 125
12.2. Equations of state 128
12.3. Transformation of the triangular factor $\boldsymbol{H}$ 129
Summary of important equations 130
Examples 131

13. Thermodynamic quantities, definitions, and geometrical situation 133
13.1. Definitions and notation 133
Summary of important equations 136

14. Thermal expansion coefficients 137
14.1. Relation between $\hat{\boldsymbol{m}}$ and $\boldsymbol{m}$ 137
14.2. Relation between $\mathring{\boldsymbol{m}}$ and $\boldsymbol{m}$ 139
14.3. Symmetry results for $\mathring{\boldsymbol{m}}$, $\hat{\boldsymbol{m}}$, $\boldsymbol{m}$ 140
Summary of important equations 141
Examples 142

15. Specific heats 144
15.1. Relation between $\hat{c}_{\boldsymbol{L}}$ and c_{Θ} 144
15.2. Relation between $\mathring{c}_{\boldsymbol{\Lambda}}$ and c_{Θ} 145
15.3. Ratios of specific heats 146
15.4. The relation between c_v, in hydrostatics, and $c_{\boldsymbol{e}}$, in infinitesimal strain theory 146
Summary of important equations 148
Examples 149

16. Elastic stiffness and compliances 150
16.1. Relations between the elastic matrices $\boldsymbol{c}$, $\hat{\boldsymbol{c}}$ 150

CAMBRIDGE

Cambridge University Press
978-0-521-18012-2 - The Classical Thermodynamics of Deformable Materials
A. G. McLellan
Table of Contents
More information

16.2. The relation between $\hat{\boldsymbol{c}}$ and $\hat{\boldsymbol{c}}$ 152
16.3. The relation between the adiabatic and isothermal elastic matrices $\boldsymbol{C}$, $\boldsymbol{S}$ 153
Summary of important equations 156
Examples 157

17. Tensorial forms for the elastic stiffness and compliance matrices 158
17.1. Tensor forms for stress and strain 158
17.2. Symmetry schemes for compliances and stiffnesses 160
17.3. The measurement of $\boldsymbol{c}$ and $\boldsymbol{s}$ 161
Summary of important equations 161
Examples (mainly to indicate the theory of acoustic wave propagation) 164

18. The effects of symmetry on the thermodynamic properties of crystals 169
18.1. The integrity basis of a finite transformation group 169
18.2. The integrity basis for polynomial invariant functions of the elements of a second rank symmetric tensor 171
18.3. More about the integrity basis for invariant polynomials of the η_α 176
18.4. The trigonal and hexagonal crystal classes and the isotropic case 177
18.5. The thermodynamic functions 179
Integrity bases for invariant functions of the elements of $\boldsymbol{\eta}$ 181
Examples 183

19. Equilibrium and stability conditions for thermodynamic systems 185
19.1. The entropy principle 185
19.2. Examples of the conditions of equilibrium 188
19.3. Comments on methods using the Gibbs free energy 193
19.4. The Gibbs free energy for equilibrium conditions in hydrostatics 194
19.5. Hydrostatic equilibrium conditions not using the Gibbs free energy 198
Summary of important equations 200
Examples 201

20. Equilibrium conditions for diffusion in phases under non-hydrostatic stresses 202
20.1. The thermodynamics of a phase of variable composition 202

Table of Contents
More information

20.2. Equilibrium conditions for diffusion within a homogeneous phase 205
20.3. Equilibrium conditions for diffusion within a multi-phase system 208
Summary of important equations 211

21. The equilibrium of a stressed solid in contact with a solution of the solid 212
21.1. Introductory comments 212
21.2. Derivation of the equilibrium conditions 213
21.3. Discussion of the condition (21.2.17) 217
21.4. The equilibrium condition (21.2.17) – stable or metastable? 218
Summary of important equations 221
Examples 222

22. The thermodynamic stability of a phase 224
22.1. The stability of a fluid phase 224
22.2. Discussion of stability 228
22.3. The stability of a solid phase under the fixed boundary condition 232
22.4. The stability of a solid phase under constant hydrostatic pressure 239
22.5. The stability of a phase under dead loading with smooth constraints 241
Summary of important equations 243
Examples 244

23. Discussion of the elastic stability conditions 247
23.1. The stiffness matrices 247
23.2. Some properties of a non-negative definite matrix 248
23.3. Another form for the elastic stability conditions for a homogeneous phase 249
Examples 250

24. Phase transitions and instability 251
24.1. Phase transitions 251
24.2. Equilibrium conditions for solid state phase transitions 254
24.3. The generalised Clausius–Clapeyron equation for coherent phase transitions under dead load 258
24.4. Phase instability 259

Table of Contents
More information

24.5. Limiting values of the isothermal compliance matrix 262
24.6. The limiting value of the isothermal compressibility 264
24.7. The relation between the instability surfaces at constant pressure and at dead loading 265
Summary of important equations 265
Examples 266

25. An example of a phase transition involving a simple shear 268
25.1. Properties of the transition 268
25.2. Thermodynamic instability at or near the transition 269
Summary of important equations 270
Example 271

26. Limiting values of thermodynamic quantities at an instability 272
26.1. Discussion of limiting values 272
26.2. The thermal expansion coefficients 274
26.3. The specific heat c_p 276
26.4. The adiabatic stiffness matrix at the instability surface 277
26.5. The Pippard relations 279
26.6. Limiting relations for diverging quantities for the case where x is zero 281
26.7. Possible limiting relations at the instability surface 283
Summary of important equations 286
Example. 287

27. The α–β quartz transition 288
27.1. A thermodynamic description of the α–β quartz transition 288
27.2. The isothermal stiffness matrix and the coefficients of expansion at the α–β quartz transition 290
27.3. Limiting values at the instability 294
27.4. The transition, the instability and the entropy change 296
Summary of important equations 298
Examples 298

28. The thermodynamic theory of the growth of Dauphiné twinning in quartz under stress 300
28.1. Description 300
28.2. The thermodynamic theory of twinning 302
28.3. The functional dependence of g' on the elements of $\boldsymbol{B}$ 306
28.4. The stress conditions of coexistence 309
28.5. The equilibrium condition and Helmholtz free energy 313

Table of Contents
More information

28.6. The relationships between the derivatives of $g'(\boldsymbol{\chi})$ and the elastic constants and compliances 314
Summary of important equations 318

29. The tetragonal/cubic ferroelectric transition of barium titanate 320
29.1. Elastic and electric properties of crystals 320
29.2. Relationships between matrix elements 324
29.3. The tetragonal phase near the instability 327
29.4. The cubic phase near the instability 330
Summary of important equations 330
