<i>Preface</i>	ix
<i>Introduction</i>	xi
1 From Lamarck to population genetics	1
2 Overdevelopment of the synthetic theory and the proposal of the neutral theory	15
2.1 Formation of the synthetic theory as the orthodox view	15
2.2 Proposal of the neutral mutation-random drift hypothesis	25
3 The neutral mutation-random drift hypothesis as an evolutionary paradigm	34
3.1 Chance acting on selectively equivalent alleles	34
3.2 Random genetic drift due to finite population size	36
3.3 Effective population size	40
3.4 Neutral and nearly neutral mutations	43
3.5 Population dynamics of mutant substitution	46
3.6 On some misunderstandings and criticisms	50
4 Molecular evolutionary rates contrasted with phenotypic evolutionary rates	55
4.1 Some features of phenotypic evolution	55
4.2 Rate of evolution at the molecular level	65
5 Some features of molecular evolution	98
6 Definition, types and action of natural selection	117
6.1 Meaning of natural selection	117
6.2 Phenotypic selection on quantitative characters	119
6.3 Genotypic selection	121
6.4 Other terminologies and concepts for natural selection	125
6.5 Genetic load	127
6.6 Fisher's model of adaptive process	135
6.7 Relation between phenotypic selection and genotypic selection	137

viii	<i>Contents</i>	
6.8	Behavior of mutant alleles in a finite population under stabilizing selection	143
7	Molecular structure, selective constraint and the rate of evolution	149
7.1	Conservative nature of mutant substitutions	149
7.2	Molecular structure and selective constraint	156
7.3	Synonymous and other silent substitutions	168
7.4	Rapid evolutionary change of pseudogenes	178
7.5	'Non-random' usage of synonymous codons	183
8	Population genetics at the molecular level	194
8.1	Why a stochastic treatment is required	194
8.2	Some models of allelic mutations	202
8.3	The age of a neutral mutant in a finite population	214
8.4	Sum of a certain quantity along a sample path of gene frequency change	221
8.5	The stepwise mutation model	229
8.6	Infinite site model	236
8.7	Model of effectively neutral mutations	240
8.8	Genetic distance	248
9	Maintenance of genetic variability at the molecular level	253
9.1	The problem, the facts, and the neutralist solution	253
9.2	Experimental check on selective neutrality	260
9.3	Statistical tests of selective neutrality	271
9.4	On some rival hypotheses	281
9.5	Effects of molecular structure and functional constraint on genetic variability	287
9.6	Frequency distribution of rare variant alleles	296
9.7	Neutral alleles in a geographically structured population	299
10	Summary and conclusion	305
