1	1
Equations of motion	
1.1	1
Introduction	
1.2	2
Properties of a fluid and the continuum assumption	
1.3	2
Dynamic and thermodynamic principles	
1.3.1	3
The rate of change of quantities following a fluid particle	
1.3.2	4
Mass and momentum conservation for a fluid system	
1.3.3	4
Thermodynamic states and state change processes for a fluid system	
1.3.4	6
First and second laws of thermodynamics for a fluid system	
1.4	8
Behavior of the working fluid	
1.4.1	8
Equations of state	
1.4.2	9
Specific heats	
1.5	11
Relation between changes in material and fixed volumes: Reynolds's Transport Theorem	
1.6	13
Conservation laws for a fixed region (control volume)	
1.7	15
Description of stress within a fluid	
1.8	19
Integral forms of the equations of motion	
1.8.1	19
Force, torque, and energy exchange in fluid devices	
1.9	20
Differential forms of the equations of motion	
1.9.1	24
Conservation of mass	
1.9.2	25
Conservation of momentum	
1.9.3	26
Conservation of energy	
1.10	26
Splitting the energy equation: entropy changes in a fluid	
1.10.1	27
Heat transfer and entropy generation sources	
1.11	28
Initial and boundary conditions	
1.11.1	29
Boundary conditions at solid surfaces	
1.11.2	30
Inlet and outlet boundary conditions	
1.12	31
The rate of strain tensor and the form of the dissipation function	
1.13	34
Relationship between stress and rate of strain	

vi	Contents	
1.14	The Navier–Stokes equations	37
1.14.1	Cartesian coordinates	38
1.14.2	Cylindrical coordinates	39
1.15	Disturbance propagation in a compressible fluid: the speed of sound	40
1.16	Stagnation and static quantities	41
1.16.1	Relation of stagnation and static quantities in terms of Mach number	42
1.17	Kinematic and dynamic flow field similarity	43
1.17.1	Incompressible flow	43
1.17.2	Kinematic similarity	44
1.17.3	Dynamic similarity	44
1.17.4	Compressible flow	45
1.17.5	Limiting forms for low Mach number	46
2	Some useful basic ideas	48
2.1	Introduction	48
2.2	The assumption of incompressible flow	48
2.2.1	Steady flow	49
2.2.2	Unsteady flow	51
2.3	Upstream influence	51
2.3.1	Upstream influence of a circumferentially periodic non-uniformity	52
2.3.2	Upstream influence of a radial non-uniformity in an annulus	54
2.4	Pressure fields and streamline curvature: equations of motion in natural coordinates	56
2.4.1	Normal and streamwise accelerations and pressure gradients	56
2.4.2	Other expressions for streamline curvature	57
2.5	Quasi-one-dimensional steady compressible flow	60
2.5.1	Corrected flow per unit area	61
2.5.2	Differential relations between area and flow variables for steady isentropic one-dimensional flow	63
2.5.3	Steady isentropic one-dimensional channel flow	65
2.6	Shock waves	65
2.6.1	The entropy rise across a normal shock	66
2.6.2	Shock structure and entropy generation processes	68
2.7	Effect of exit conditions on steady, isentropic, one-dimensional compressible channel flow	71
2.7.1	Flow regimes for a converging nozzle	72
2.7.2	Flow regimes for a converging–diverging nozzle	74
2.8	Applications of the integral forms of the equations of motion	76
2.8.1	Pressure rise and mixing losses at a sudden expansion	76
2.8.2	Ejector performance	78

vii	Contents	
	2.8.3 Fluid force on turbomachinery blading	80
	2.8.4 The Euler turbine equation	83
	2.8.5 Thrust force on an inlet	84
	2.8.6 Thrust of a cylindrical tube with heating or cooling (idealized ramjet)	86
	2.8.7 Oblique shock waves	87
2.9	Boundary layers	89
	2.9.1 Features of boundary layers in ducts	89
	2.9.2 The influence of boundary layers on the flow outside the viscous region	91
	2.9.3 Turbulent boundary layers	94
2.10	Inflow and outflow in fluid devices: separation and the asymmetry of real fluid motions	94
	2.10.1 Qualitative considerations concerning flow separation from solid surfaces	94
	2.10.2 The contrast between flow in and out of a pipe	96
	2.10.3 Flow through a bent tube as an illustration of the principles	98
	2.10.4 Flow through a sharp edged orifice	100

3	Vorticity and circulation	104
3.1	Introduction	104
3.2	Vorticity kinematics	105
	3.2.1 Vortex lines and vortex tubes	107
	3.2.2 Behavior of vortex lines at a solid surface	110
3.3	Vorticity dynamics	111
3.4	Vorticity changes in an incompressible, uniform density, inviscid flow with conservative body force	112
	3.4.1 Examples: Secondary flow in a bend, horseshoe vortices upstream of struts	114
	3.4.2 Vorticity changes and angular momentum changes	117
3.5	Vorticity changes in an incompressible, non-uniform density, inviscid flow	119
	3.5.1 Examples of vorticity creation due to density non-uniformity	121
3.6	Vorticity changes in a uniform density, viscous flow with conservative body forces	122
	3.6.1 Vorticity changes and viscous torques	124
	3.6.2 Diffusion and intensification of vorticity in a viscous vortex	125
	3.6.3 Changes of vorticity in a fixed volume	127
	3.6.4 Summary of vorticity evolution in an incompressible flow	128
3.7	Vorticity changes in a compressible inviscid flow	128
3.8	Circulation	130

viii	Contents	
	3.8.1 Kelvin's Theorem	130
3.9	Circulation behavior in an incompressible flow	132
	3.9.1 Uniform density inviscid flow with conservative body forces	132
	3.9.2 Incompressible, non-uniform density, inviscid flow with conservative body forces	134
	3.9.3 Uniform density viscous flow with conservative body forces	135
3.10	Circulation behavior in a compressible inviscid flow	135
	3.10.1 Circulation generation due to shock motion in a non-homogeneous medium	135
3.11	Rate of change of circulation for a fixed contour	137
3.12	Rotational flow descriptions in terms of vorticity and circulation	138
	3.12.1 Behavior of vortex tubes when $D\Gamma / Dt = 0$	139
	3.12.2 Evolution of a non-uniform flow through a diffuser or nozzle	140
	3.12.3 Trailing vorticity and trailing vortices	142
3.13	Generation of vorticity at solid surfaces	144
	3.13.1 Generation of vorticity in a two-dimensional flow	145
	3.13.2 Vorticity flux in thin shear layers (boundary layers and free shear layers)	149
	3.13.3 Vorticity generation at a plane surface in a three-dimensional flow	151
3.14	Relation between kinematic and thermodynamic properties in an inviscid, non-heat-conducting fluid: Crocco's Theorem	152
	3.14.1 Applications of Crocco's Theorem	153
3.15	The velocity field associated with a vorticity distribution	156
	3.15.1 Application of the velocity representation to vortex tubes	158
	3.15.2 Application to two-dimensional flow	159
	3.15.3 Surface distributions of vorticity	159
	3.15.4 Some specific velocity fields associated with vortex structures	160
	3.15.5 Numerical methods based on the distribution of vorticity	163

4 **Boundary layers and free shear layers** **166**

4.1	Introduction	166
	4.1.1 Boundary layer behavior and device performance	167
4.2	The boundary layer equations for plane and curved surfaces	170
	4.2.1 Plane surfaces	170
	4.2.2 Extension to curved surfaces	173
4.3	Boundary layer integral quantities and the equations that describe them	173
	4.3.1 Boundary layer integral thicknesses	173
	4.3.2 Integral forms of the boundary layer equations	176
4.4	Laminar boundary layers	177
	4.4.1 Laminar boundary layer behavior in favorable and adverse pressure gradients	177

ix	Contents	
	4.4.2 Laminar boundary layer separation	179
4.5	Laminar–turbulent boundary layer transition	182
4.6	Turbulent boundary layers	184
	4.6.1 The time mean equations for turbulent boundary layers	184
	4.6.2 The composite nature of a turbulent boundary layer	187
	4.6.3 Introductory discussion of turbulent shear stress	189
	4.6.4 Boundary layer thickness and wall shear stress in laminar and turbulent flow	191
	4.6.5 Vorticity and velocity fluctuations in turbulent flow	193
4.7	Applications of boundary layer analysis: viscous–inviscid interaction in a diffuser	195
	4.7.1 Qualitative description of viscous–inviscid interaction	197
	4.7.2 Quantitative description of viscous–inviscid interaction	198
	4.7.3 Extensions of interactive boundary layer theory to other situations	201
	4.7.4 Turbulent boundary layer separation	201
4.8	Free turbulent flows	202
	4.8.1 Similarity solutions for incompressible uniform-density free shear layers	202
	4.8.2 The mixing layer between two streams	205
	4.8.3 The effects of compressibility on free shear layer mixing	208
	4.8.4 Appropriateness of the similarity solutions	210
4.9	Turbulent entrainment	211
4.10	Jets and wakes in pressure gradients	212
5	Loss sources and loss accounting	217
	5.1 Introduction	217
	5.2 Losses and entropy change	218
	5.2.1 Losses in a spatially uniform flow through a screen or porous plate	218
	5.2.2 Irreversibility, entropy generation, and lost work	220
	5.2.3 Lost work accounting in fluid components and systems	222
5.3	Loss accounting and mixing in spatially non-uniform flows	225
5.4	Boundary layer losses	227
	5.4.1 Entropy generation in boundary layers on adiabatic walls	227
	5.4.2 The boundary layer dissipation coefficient	230
	5.4.3 Estimation of turbomachinery blade profile losses	233
5.5	Mixing losses	234
	5.5.1 Mixing of two streams with non-uniform stagnation pressure and/or temperature	234
	5.5.2 The limiting case of low Mach number ($M^2 \ll 1$) mixing	237

x	Contents	
	5.5.3	Comments on loss metrics for flows with non-uniform temperatures 239
	5.5.4	Mixing losses from fluid injection into a stream 239
	5.5.5	Irreversibility in mixing 241
	5.5.6	A caveat: smoothing out of a flow non-uniformity does not always imply loss 242
5.6		Averaging in non-uniform flows: the average stagnation pressure 244
	5.6.1	Representation of a non-uniform flow by equivalent average quantities 244
	5.6.2	Averaging procedures in an incompressible uniform-density flow 245
	5.6.3	Effect of velocity distribution on average stagnation pressure (incompressible, uniform-density flow) 248
	5.6.4	Averaging procedures in compressible flow 250
	5.6.5	Appropriate average values for stagnation quantities in a non-uniform flow 253
5.7		Streamwise evolution of losses in fluid devices 258
	5.7.1	Stagnation pressure averages and integral boundary layer parameters 258
	5.7.2	Comparison of losses within a device to losses from downstream mixing 261
5.8		Effect of base pressure on mixing losses 262
5.9		Effect of pressure level on average properties and mixing losses 267
	5.9.1	Two-stream mixing 267
	5.9.2	Mixing of a linear shear flow in a diffuser or nozzle 269
	5.9.3	Wake mixing 273
5.10		Losses in turbomachinery cascades 274
5.11		Summary concerning loss generation and characterization 277

6	Unsteady flow	279
6.1	Introduction	279
6.2	The inherent unsteadiness of fluid machinery	279
6.3	The reduced frequency	281
	6.3.1	An example of the role of reduced frequency: unsteady flow in a channel 282
6.4	Examples of unsteady flows	286
	6.4.1	Stagnation pressure changes in an irrotational incompressible flow 286
	6.4.2	The starting transient for incompressible flow exiting a tank 286
	6.4.3	Stagnation pressure variations due to the motion of an isolated airfoil 288
	6.4.4	Moving blade row (moving row of bound vortices) 290
	6.4.5	Unsteady wake structure and energy separation 292

xi	Contents	
6.5	Shear layer instability	297
6.5.1	Instability of a vortex sheet (Kelvin–Helmholtz instability)	298
6.5.2	General features of parallel shear layer instability	300
6.6	Waves and oscillation in fluid systems: system instabilities	303
6.6.1	Transfer matrices (transmission matrices) for fluid components	305
6.6.2	Examples of unsteady behavior in fluid systems	310
6.6.3	Nonlinear oscillations in fluid systems	315
6.7	Multi-dimensional unsteady disturbances in a compressible inviscid flow	321
6.8	Examples of fluid component response to unsteady disturbances	324
6.8.1	Interaction of entropy and pressure disturbances	324
6.8.2	Interaction of vorticity and pressure disturbances	328
6.8.3	Disturbance interaction caused by shock waves	334
6.8.4	Irrotational disturbances and upstream influence in a compressible flow	334
6.8.5	Summary concerning small amplitude unsteady disturbances	336
6.9	Some Features of unsteady viscous flows	337
6.9.1	Flow due to an oscillating boundary	337
6.9.2	Oscillating channel flow	338
6.9.3	Unsteady boundary layers	340
6.9.4	Dynamic stall	343
6.9.5	Turbomachine wake behavior in an unsteady environment	344
7	Flow in rotating passages	347
7.1	Introduction	347
7.1.1	Equations of motion in a rotating coordinate system	347
7.1.2	Rotating coordinate systems and Coriolis accelerations	349
7.1.3	Centrifugal accelerations in a uniform density fluid: the reduced static pressure	353
7.2	Illustrations of Coriolis and centrifugal forces in a rotating coordinate system	353
7.3	Conserved quantities in a steady rotating flow	355
7.4	Phenomena in flows where rotation dominates	357
7.4.1	Non-dimensional parameters: the Rossby and Ekman numbers	357
7.4.2	Inviscid flow at low Rossby number: the Taylor–Proudman Theorem	358
7.4.3	Viscous flow at low Rossby number: Ekman layers	359
7.5	Changes in vorticity and circulation in a rotating flow	363
7.6	Flow in two-dimensional rotating straight channels	365
7.6.1	Inviscid flow	365
7.6.2	Coriolis effects on boundary layer mixing and stability	367
7.7	Three-dimensional flow in rotating passages	369

xii	Contents	
	7.7.1	Generation of cross-plane circulation in a rotating passage 369
	7.7.2	Fully developed viscous flow in a rotating square duct 373
	7.7.3	Comments on viscous flow development in rotating passages 378
7.8		Two-dimensional flow in rotating diffusing passages 380
	7.8.1	Quasi-one-dimensional approximation 380
	7.8.2	Two-dimensional inviscid flow in a rotating diffusing blade passage 382
	7.8.3	Effects of rotation on diffuser performance 384
7.9		Features of the relative flow in axial turbomachine passages 385
8	Swirling flow	389
	8.1	Introduction 389
	8.2	Incompressible, uniform-density, inviscid swirling flows in simple radial equilibrium 390
	8.2.1	Examples of simple radial equilibrium flows 391
	8.2.2	Rankine vortex flow 393
	8.3	Upstream influence in a swirling flow 394
	8.4	Effects of circulation and stagnation pressure distributions on upstream influence 397
	8.5	Instability in swirling flow 404
	8.6	Waves on vortex cores 406
	8.6.1	Control volume equations for a vortex core 406
	8.6.2	Wave propagation in unconfined geometries 408
	8.6.3	Wave propagation and flow regimes in confined geometries: swirl stabilization of Kelvin–Helmholtz instability 410
	8.7	Features of steady vortex core flows 411
	8.7.1	Pressure gradients along a vortex core centerline 411
	8.7.2	Axial and circumferential velocity distributions in vortex cores 414
	8.7.3	Applicability of the Rankine vortex model 414
	8.8	Vortex core response to external conditions 416
	8.8.1	Unconfined geometries (steady vortex cores with specified external pressure variation) 416
	8.8.2	Confined geometries (steady vortex cores in ducts with specified area variation) 420
	8.8.3	Discontinuous vortex core behavior 422
	8.9	Swirling flow boundary layers 426
	8.9.1	Swirling flow boundary layers on stationary surfaces and separation in swirling flow 426
	8.9.2	Swirling flow boundary layers on rotating surfaces 431
	8.9.3	The enclosed rotating disk 433
	8.9.4	Internal flow in gas turbine engine rotating disk cavities 434

xiii	Contents	
	8.10 Swirling jets	437
	8.11 Recirculation in axisymmetric swirling flow and vortex breakdown	440
9	Generation of streamwise vorticity and three-dimensional flow	446
	9.1 Introduction	446
	9.2 A basic illustration of secondary flow: a boundary layer in a bend	446
	9.2.1 Qualitative description	446
	9.2.2 A simple estimate for streamwise vorticity generation and cross-flow plane velocity components	448
	9.2.3 A quantitative look at secondary flow in a bend: measurements and three-dimensional computations	451
	9.3 Additional examples of secondary flow	451
	9.3.1 Outflow of swirling fluid from a container	451
	9.3.2 Secondary flow in an S-shaped duct	455
	9.3.3 Streamwise vorticity and secondary flow in a two-dimensional contraction	456
	9.3.4 Three-dimensional flow in turbine passages	457
	9.4 Expressions for the growth of secondary circulation in an inviscid flow	461
	9.4.1 Incompressible uniform density fluid	461
	9.4.2 Incompressible non-uniform density fluid	463
	9.4.3 Perfect gas with constant specific heats	464
	9.5 Applications of secondary flow analyses	465
	9.5.1 Approximations based on convection of vorticity by a primary flow	465
	9.5.2 Flow with large distortion of the stream surfaces	466
	9.6 Three-dimensional boundary layers: further remarks on effects of viscosity in secondary flow	469
	9.7 Secondary flow in a rotating reference frame	472
	9.7.1 Absolute vorticity as a measure of secondary circulation	472
	9.7.2 Generation of secondary circulation in a rotating reference frame	473
	9.7.3 Expressions for, and examples of, secondary circulation in rotating systems	474
	9.7.4 Non-uniform density flow in rotating passages	477
	9.8 Secondary flow in rotating machinery	477
	9.8.1 Radial migration of high temperature fluid in a turbine rotor	478
	9.9 Streamwise vorticity and mixing enhancement	481
	9.9.1 Lobed mixers and streamwise vorticity generation	481
	9.9.2 Vortex-enhanced mixing	484
	9.9.3 Additional aspects of mixing enhancement in lobed mixers	491
	9.10 Fluid impulse and vorticity generation	494

xiv **Contents**

9.10.1	Creation of a vortex ring by a distribution of impulses	495
9.10.2	Fluid impulse and lift on an airfoil	497
9.10.3	Far field behavior of a jet in cross-flow	499

10 **Compressible internal flow** **506**

10.1	Introduction	506
10.2	Corrected flow per unit area	506
10.3	Generalized one-dimensional compressible flow analysis	509
10.3.1	Differential equations for one-dimensional flow	509
10.3.2	Influence coefficient matrix for one-dimensional flow	512
10.3.3	Effects of shaft work and body forces	512
10.4	Effects of friction and heat addition on compressible channel flow	517
10.4.1	Constant area adiabatic flow with friction	517
10.4.2	Constant area frictionless flow with heat addition	518
10.4.3	Results for area change, friction, and heat addition	519
10.5	Starting and operation of supersonic diffusers and inlets	522
10.5.1	The problem of starting a supersonic flow	522
10.5.2	The use of variable geometry to start the flow	524
10.5.3	Starting of supersonic inlets	525
10.6	Characteristics of supersonic flow in passages and channels	527
10.6.1	Turbomachinery blade passages	527
10.6.2	Shock wave patterns in ducts and shock train behavior	528
10.7	Extensions of the one-dimensional concepts – I: axisymmetric compressible swirling flow	532
10.7.1	Development of equations for compressible swirling flow	533
10.7.2	Application of influence coefficients for axisymmetric compressible swirling flow	537
10.7.3	Behavior of corrected flow per unit area in a compressible swirling flow	544
10.8	Extensions of the one-dimensional concepts – II: compound-compressible channel flow	546
10.8.1	Introduction to compound flow: two-stream low Mach number (incompressible) flow in a converging nozzle	546
10.8.2	Qualitative considerations for multistream compressible flow	549
10.8.3	Compound-compressible channel flow theory	551
10.8.4	One-dimensional compound waves	554
10.8.5	Results for two-stream compound-compressible flows	556
10.9	Flow angle, Mach number, and pressure changes in isentropic supersonic flow	564
10.9.1	Differential relationships for small angle changes	565
10.9.2	Relationships for finite angle changes: Prandtl–Meyer flows	567
10.10	Flow field invariance to stagnation temperature distribution: the Munk and Prim substitution principle	569

xv	Contents	
	10.10.1 Two-dimensional flow	570
	10.10.2 Three-dimensional flow	572
	10.10.3 Flow from a reservoir with non-uniform stagnation temperature	573
11	Flow with heat addition	575
	11.1 Introduction: sources of heat addition	575
	11.2 Heat addition and vorticity generation	577
	11.3 Stagnation pressure decrease due to heat addition	579
	11.4 Heat addition and flow state changes in propulsion devices	582
	11.4.1 The H - K diagram	582
	11.4.2 Flow processes in ramjet and scramjet systems	586
	11.5 An illustration of the effect of condensation on compressible flow behavior	590
	11.6 Swirling flow with heat addition	592
	11.6.1 Results for vortex core behavior with heat addition	596
	11.7 An approximate substitution principle for viscous heat conducting flow	599
	11.7.1 Equations for flow with heat addition and mixing	599
	11.7.2 Two-stream mixing as a model problem–I: constant area, low Mach number, uniform inlet stagnation pressure	601
	11.7.3 Two-stream mixing as a model problem– II: non-uniform inlet stagnation pressures	604
	11.7.4 Effects of inlet Mach number level	605
	11.8 Applications of the approximate principle	607
	11.8.1 Lobed mixer nozzles	607
	11.8.2 Jets	609
	11.8.3 Ejectors	610
	11.8.4 Mixing of streams with non-uniform densities	613
	11.8.5 Comments on the approximations	614
12	Non-uniform flow in fluid components	615
	12.1 Introduction	615
	12.2 An illustrative example of flow modeling: two-dimensional steady non-uniform flow through a screen	616
	12.2.1 Velocity and pressure field upstream of the screen	617
	12.2.2 Flow in the downstream region	620
	12.2.3 Matching conditions across the screen	620
	12.2.4 Overall features of the solution	622
	12.2.5 Nonlinear effects	625
	12.2.6 Disturbance length scales and the assumption of inviscid flow	625
	12.3 Applications to creation of a velocity non-uniformity using screens	628

xvi	Contents	
	12.3.1	Flow through a uniform inclined screen 628
	12.3.2	Pressure drop and velocity field with partial duct blockage 629
	12.3.3	Enhancing flow uniformity in diffusing passages 631
12.4		Upstream influence and component interaction 634
12.5		Non-axisymmetric (asymmetric) flow in axial compressors 637
	12.5.1	Flow upstream of the compressor 638
	12.5.2	Flow downstream of the compressor 639
	12.5.3	Matching conditions across the compressor 640
	12.5.4	Behavior of the axial velocity and upstream static pressure 641
	12.5.5	Generation of non-uniform flow by circumferentially varying tip clearance 644
12.6		Additional examples of upstream effects in turbomachinery flows 645
	12.6.1	Turbine engine effects on inlet performance 645
	12.6.2	Strut-vane row interaction: upstream influence with two different length scales 647
12.7		Unsteady compressor response to asymmetric flow 648
	12.7.1	Self-excited propagating disturbances in axial compressors and compressor instability 651
	12.7.2	A deeper look at the effects of circumferentially varying tip clearance 653
	12.7.3	Axial compressor response to circumferentially propagating distortions 654
12.8		Nonlinear descriptions of compressor behavior in asymmetric flow 655
12.9		Non-axisymmetric flow in annular diffusers and compressor–component coupling 658
	12.9.1	Quasi-two-dimensional description of non-axisymmetric flow in an annular diffuser 661
	12.9.2	Features of the diffuser inlet static pressure field 663
	12.9.3	Compressor–component coupling 666
12.10		Effects of flow non-uniformity on diffuser performance 668
12.11		Introduction to non-axisymmetric swirling flows 673
	12.11.1	A simple approach for long length scale non-uniformity 675
	12.11.2	Explicit forms of the velocity disturbances 677
	12.11.3	Flow angle disturbances 677
	12.11.4	Relations between stagnation pressure, static pressure, and flow angle disturbances 678
	12.11.5	Overall features of non-axisymmetric swirling flow 678
	12.11.6	A secondary flow approach to non-axisymmetric swirling flow 682
