This volume addresses the problems arising from pollutants that all too commonly contaminate the indoor environment, including biological sources such as bacteria, fungi and moulds, common combustion products, radon and other sources of radiation, solvents used in industry and the home, asbestos and dust pollution. The aim is to provide a balanced account of the health risks associated with these major pollutants and to quantify the scale of the problem on a pollutant-by-pollutant basis. Each chapter covers exposure levels, sources of pollution and routes of uptake, health effects, control measures, and regulatory guidelines.
INDOOR AIR POLLUTION:
problems and priorities

G. B. LESLIE
Independent Consultant in Toxicology

F. W. LUNAU
Independent Consultant in Occupational Hygiene
CONTENTS

Contributors viii

1 Introduction 1
    F. W. LUNAU and G. B. LESLIE

2 The perception of indoor air quality 9
    F. W. LUNAU

3 Legionella 19
    J. B. KURTZ

4 Bacteria, fungi and other micro-organisms 29
    P. SHERWOOD BURGE

5 The oxides of nitrogen 63
    J. M. SNEDDON

6 Mineral fibres 77
    R. C. BROWN, J. A. HOSKINS and A. POOLE

7 Radon 99
    T. LINDVALL

8 Formaldehyde 117
    G. R. BETTON

9 Hazards from solvents, pesticides and PCBs 131
    D. E. RAY

10 Vegetable dusts and lung disease 161
    P. J. NICHOLLS

11 Danders, etc from domestic and laboratory animals 183
    G. CLOUGH

12 Environmental tobacco smoke 193
    D. F. WEETMAN

13 Industrial environments 239
    G. W. CROCKFORD

14 Extremely low frequency electromagnetic radiation 263
    L. H. HAWKINS
Contents

15 Contributions from outdoor pollutants 275
   G. W. CROCKFORD

16 Ventilation for control of airborne pollutants 287
   P. APPLEBY

CONTRIBUTORS

P. APPLEBY, BSc(Hons), CEng, MCIBSE, MASHRAE, is a building services engineer with experience in consultancy, contracting, lecturing and research, and is currently Managing Director of London-based Building Health Consultants Ltd, specialising in the diagnosis, prevention and alleviation of building-related illnesses and indoor environment problems.

DR G. R. BETTON is a veterinary pathologist specialising in the field of toxicologic pathology with particular interest in carcinogenesis. He has been Head of Pathology at Smith Kline and Beckman UK and at Unilever and is presently Head of Pathology at ICI, Pharmaceuticals Division at Alderley Park, Cheshire.

DR R. C. BROWN is a senior scientist with the UK Medical Research Council. He is interested in all types of environmental hazard but with an especial interest in pulmonary carcinogenesis and its relation to smoking and other exposures. His primary research interest is the biological effects of mineral fibres which he has been studying for 15 years both at the MRC Toxicology Unit and at the now defunct Pneumoconiosis Unit.

DR P. SHERWOOD BURGE is a consultant physician with a particular interest in occupational lung and environment diseases in Birmingham and Solihull. His main research has been occupational asthma and alveolitis and in problems of indoor air quality. He trained in clinical immunology with Professor Pepys at the Brompton Hospital and lung medicine at the Brompton Hospital, and in occupational medicine at the London School of Hygiene with Professor Corbett McDonald.

DR G. CLOUGH, is a consultant environmental physiologist with special interests in environmental control and monitoring, the control of disease transmission and the maintenance of gnotobiotic environments.

G. W. CROCKFORD, BSc, MBIol, MIOH, is a Fellow of the Ergonomics Society and is a Registered Occupational Hygienist. He is an Honorary Consultant in Occupational Hygiene at the Robens Institute of Industrial and Environmental Health at the University of Surrey, UK.
Contributors

DR L. H. HAWKINS, BSc, PhD, is an environmental physiologist specialising in Health and the Indoor Environment. He is Senior Lecturer in Applied Physiology and Head of the Occupational Health Unit in the Robens Institute of Environmental and Occupational Health and Safety at the University of Surrey, UK.

DR J. A. HOSKINS is a scientist with the Medical Research Council in their Toxicology Unit. He is a chemist by training who has studied both in England and Australia and has been involved in medical research for over 20 years. His special interests are in metabolic management and control, particularly the disruption to this caused by mineral fibres.

DR J. B. KURTZ is consultant virologist to the Oxford Health Authority and Honorary Clinical Lecturer, Oxford University. He has been involved in research into environmental aspects of *Legionella pneumophila* since 1978.

G. B. LESLIE, FRCPath is a consultant toxicologist who was, for 13 years, Head of Toxicology at Smith Kline & French, UK.

PROFESSOR T. LINDVALL is on the staff of the Karolinska Institute in Stockholm.

F. W. LUNAU, MSc, DFH, C Eng. Dip. Occ. Hyg., MIEE, MIOH is a Chartered Engineer and a Registered Occupational Hygienist. As a consultant Occupational Hygienist, his work has covered a wide variety of assignments in the engineering, electronics, chemical and food industries. Latterly he has specialised in office environmental problems. He is a former Executive Secretary of the British Occupational Hygiene Society and is the President of the International Association for Indoor Air Quality. He was awarded the Bedford Memorial Prize of BOHS in 1967.

DR P. NICHOLLS, BSc, PhD, is Professor of Pharmacology and Head of the Division of Pharmacology in the Welsh School of Pharmacy at the University of Wales. He has a long-standing research interest in the study of occupational diseases caused by inhalation of vegetable dusts.

DR A. POOLE, BSc, PhD, a graduate of the Universities of Wales and Surrey, and a Member of The Royal College of Pathologists, has had wide experience in both academic and industrial areas of toxicology. His interests lie in understanding mechanisms of toxicological and carcino- genic effects. He is currently employed as project manager, in Health and Environmental Sciences, the Dow Chemical Company.
Contributors

DR D. E. RAY was born in Oxfordshire in 1952 and studied at King’s College London, obtaining a BSc in Biochemistry and Physiology followed by a PhD on the neurotoxicity of hyperbaric oxygen. His current research at the Medical Research Council Toxicology Unit is on the physiological response to natural and synthetic neurotoxins.

DR J. M. SNEDDON, BSc, PhD, is Head of the School of Pharmacology at Sunderland Polytechnic, UK. He was awarded the Sandoz Prize of the British Pharmacology Society in 1973 and has been an editor of the *British Journal of Pharmacology* since 1968. He was the recipient of the Visiting Scientist Award at the Alberta Heritage Foundation for Medical Research at the University of Alberta, Canada from 1981 to 1984. His research interests are in cardiovascular and respiratory diseases.

D. F. WEETMAN is Professor of Pharmacology at Sunderland Polytechnic, where he has occupied various academic positions for more than 20 years. Amongst his many interests and activities in the medical sciences, he specialises in communication between cells, experimental design and all aspects of drug development.
