The economy of the earth
Cambridge Studies in Philosophy and Public Policy

General Editor: Douglas MacLean

The purpose of this new series is to publish the most innovative and up-to-date research into the values and concepts that underlie major aspects of public policy. Hitherto most research in this field has been empirical. This series will be primarily conceptual and normative; that is, it will investigate the structure of arguments and the nature of values relevant to the formation, justification, and criticism of public policy. At the same time it will be informed by empirical considerations, addressing specific issues, general policy concerns, and the methods of policy analysis and their applications.

The books in the series will be inherently interdisciplinary and will include anthologies as well as monographs. They will be of particular interest to philosophers, political and social scientists, economists, policy analysts, and those involved in public administration and environmental policy.
The economy of the earth

Philosophy, law, and the environment

Acknowledgments

I wrote almost all of this book while a research associate at the Center for Philosophy and Public Policy at the University of Maryland. There is little in this essay that did not arise out of discussion with my colleagues at the Center, or from some thought suggested by their work, or in response to their sympathetic criticism, or to the ideas they offered me. No institute other than the Center for Philosophy and Public Policy, as far as I know, provides a similar opportunity for philosophers to pursue politically informed conceptual analysis on a sustained basis. Each page of this book acknowledges implicitly, as I do explicitly here, the help I received from my colleagues at the Center, Robert Fullinwider, Judith Lichtenberg, David Luban, Douglas MacLean, Claudia Mills, and Henry Shue. I should also like to thank Carroll Linkins, who dealt cheerfully and patiently with the secretarial problems I created in writing and revising this manuscript.

I am deeply grateful to good friends outside the Center who have encouraged my efforts and guided my thoughts, especially Max Black, Philip Bobbitt, Peter Jutro, and Sheldon Novick. Colleagues in philosophy and in other fields, moreover, reviewed earlier versions of this book and sent me extensive and penetrating written criticisms. I am grateful to C. Edwin Baker, Robert Goodin, Toby Page, and Clifford Russell, who, along with several anonymous reviewers, have helped make the book better, although some of them may disagree with much that it contains.

The National Science Foundation, especially the Ethics and Values Studies program, headed by Rachelle Hollander, over the years has supported my research. Working within a tiny budget, Dr. Hollander has helped to create the field of ethical analysis of science and technology; she is in large measure responsible for its devel-
opment. All of us who work in this interdisciplinary area know how important her energetic advice and guidance have been; the EVS program exemplifies the very best way the government may support scholarship. I should also like gratefully to acknowledge additional support I have received from the National Endowment for the Humanities, the Maryland Sea Grant Program, and the Environmental Protection Agency. The views expressed in the book are those of the author only, however, not necessarily those of any governmental agency.

I wish to thank my wife, Kendra, and children, Jared and Amelia, for giving me the energy I needed to complete this book. They provide the reason and the reward for writing; they teach me “not from the positions of philosophers but from the fabric of nature.”
