<i>Editor's Foreword</i>	xiii
<i>Notation</i>	xvii
Chapter I Historical introduction: photons and measurements using photons	1
1.1 The discovery of photons	2
1.2 The wave and particle properties of photons	4
1.3 The Heisenberg uncertainty relations	7
1.4 When do macroscopic objects behave quantum mechanically?	12
1.5 Overview of this book	15
Chapter II The main principles of quantum mechanics	17
2.1 The wave function	17
2.2 Probabilistic interpretation of the wave function	19
2.3 Single measurements and ensembles of measurements	21
2.4 Reduction of a quantum state	24
2.5* von Neumann's postulate of reduction	27
2.6* Orthogonal measurements	30
2.7* Nonorthogonal measurements	32
2.8* Back action of the measuring device on the measured object	35

* For an explanation of the asterisks, see the first page of Chapter I.

viii	Contents
Chapter III Indirect measurements	38
3.1 The two main types of quantum measurements	38
3.2 An electron as the quantum probe	41
3.3* Electron probe — detailed analysis	44
3.4* Formal description of an indirect measurement	46
Chapter IV Quantum nondemolition measurements	50
4.1 The standard quantum limit for the energy of an oscillator	50
4.2 How can one overcome the standard quantum limit?	53
4.3 The ponderomotive probe for energy	57
4.4* Criteria for QND measurements	60
Chapter V Linear measurements	64
5.1 The measurement process and the uncertainty relation	64
5.2* Measurement accuracy and perturbations for linear measurements	67
5.3* Sequences of linear measurements	70
Chapter VI Continuous linear measurements	76
6.1 Discrete and continuous measurements	76
6.2 Uncertainty relations for continuous linear measurements	77
6.3* Uncertainty relations for continuous linear measurements —rigorous analysis	82
6.4* Linear, quantum $2N$ -pole systems	84
6.5* The spectral representation	87
6.6* Internal fluctuations of a linear measuring device	89
Chapter VII Nonlinear systems for continuous measurements	93
7.1 Fluctuational and dynamical back action of the measuring device	93
7.2 Quantum Zeno paradox for exact measurements	95
7.3* The equation of motion for the density operator during a continuous monitoring	97
7.4* Quantum Zeno paradox for approximate measurements	101
Chapter VIII Detection of classical forces	105
8.1 Aspects of quantum limits for the detection of a classical force	105
8.2 Quantum probe oscillator	109

Contents	ix
8.3 Continuous quantum nondemolition monitoring	112
8.4* Standard quantum limit for an oscillator	115
8.5* Optimal detection of a classical force	118
8.6* A probe oscillator coupled to a sensor that continuously monitors its number of quanta	122
Chapter IX Energetic quantum limitations	125
9.1 The energy of the probe and the minimum detectable force	125
9.2* Energetic limits on sensitivity: general analysis	129
9.3* Distinguishing evolutionary paths of a quantum object from each other	132
Chapter X Devices for measuring small mechanical displacements	136
10.1 Parametric transducer for mechanical displacements	136
10.2 Capacity transducer	139
10.3 Fluctuations in a capacity transducer in the stationary regime	143
10.4 Capacity transducer used to detect weak forces: stationary regime	148
10.5* Capacity transducer: nonstationary regime	151
10.6* Frequency upconverter	154
10.7* Capacity transducer with two-side-band pumping	157
Chapter XI Quantum nondemolition measurements of a resonator's energy	160
11.1 Review of methods of measurement	160
11.2 Measuring device based on cubic dielectric nonlinearity	162
11.3 The role of dissipation	165
11.4* Resonator coupled to a waveguide	167
Chapter XII Nonclassical states of electromagnetic waves as tools for quantum measurements	172
12.1 Quantum properties of a traveling electromagnetic wave	172
12.2 QND measurements of the energy of a traveling electromagnetic wave	175
12.3 Frequency-anticorrelated quantum state	178
12.4 Doppler measurements with frequency-anticorrelated photons	180

x	Contents
12.5*	Statistical properties of a wave packet with a definite number of quanta
	183
Conclusion	186
