CONTENTS

Preface xiii
Abbreviations xvii

1 PCM signals and systems 1
1.1 The ideal coding concept 1
1.2 Fundamentals of PCM 3
1.2.1 PCM bandwidth 3
1.2.2 PCM channel capacity 5
1.3 Ideal sampling and reconstruction of signals 7
1.3.1 Bandpass sampling 10
1.3.2 Multidimensional sampling 11
1.4 Practical sampling and reconstruction 12
1.4.1 Decimation 15
1.4.2 Interpolation 18
1.4.3 Sub-Nyquist sampling 22
1.5 Quantization 24
1.5.1 Quantizing characteristics and coding 24
1.5.2 Quantizing noise 26
1.5.3 SNR in PCM systems 30
1.6 Source and channel coding 33
1.6.1 Source coding 34
1.6.2 Coding standards 35
1.6.3 Channel coding 37

2 Source coding 38
2.1 Reversible coding 38
2.1.1 Run-length coding 39
2.1.2 Information measure and source entropy 42
2.1.3 Conditional entropy 45
2.1.4 Variable-length coding 51
2.1.5 Huffman coding 54
2.1.6 The LZW string compression algorithm 63

Table of Contents
More information

2.2 Non-reversible coding – differential PCM (DPCM) 66
2.2.1 Principles of DPCM 67
2.2.2 DPCM quantizer design 69
2.2.3 DPCM predictor design 72
2.2.4 Adaptive DPCM (ADPCM) 78
2.2.5 DPCM coding gain 83
2.3 Non-reversible coding – transform coding (TC) 86
2.3.1 Linear transformation 86
2.3.2 Energy compaction 90
2.3.3 TC of images and coefficient quantization 92
2.3.4 Hybrid DPCM–TC 95
2.4 Non-reversible coding – CELP coding 97
2.5 Non-reversible coding – linear predictive coding (LPC) 100
2.5.1 Regular-pulse excited linear predictive coding (RPE-LPC) 103

3 Channel coding 106
3.1 Overview of ECC 106
3.1.1 Distinctions between block and convolutional codes 109
3.1.2 Code distance 112
3.1.3 Some algebraic concepts 114
3.2 Matrix description of block codes 115
3.2.1 Coding and decoding principles 115
3.2.2 Hamming codes 118
3.2.3 Modified Hamming codes 120
3.3 Polynomial description of block codes: cyclic codes 125
3.3.1 Polynomial multiplication and division 126
3.3.2 Systematic cyclic codes 129
3.3.3 Binary BCH codes 133
3.3.4 Interleaving 138
3.3.5 Cyclic redundancy check (CRC) codes 139
3.4 Non-algebraic decoding of cyclic codes 141
3.4.1 The Meggitt decoder 141
3.4.2 Burst detection 146
3.5 Algebraic decoding of cyclic codes 146
3.5.1 Galois field theory 147
3.5.2 Decoding binary BCH codes 151
3.5.3 Reed–Solomon (RS) codes 156
3.6 Performance of hard decoders 163
3.6.1 Decoded error rate 164
3.6.2 Coding gain 167
3.7 Convolutional codes 169
3.7.1 Polynomial representation 170
3.7.2 Trellis representation 173
3.7.3 Distance measures 175
3.7.4 Threshold decoding 176
3.7.5 Maximum likelihood decoding 184

Table of Contents
More information

3.7.6 Viterbi decoding algorithm 185
3.8 Transmission codes 191
3.8.1 Nyquist pulses (binary transmission) 194
3.8.2 Fundamental requirements of transmission codes 197
3.8.3 Manchester (biphase) code 201
3.8.4 AMI and HDBn codes 202
3.8.5 Alphabetic ternary codes 204
3.8.6 Runlength-limited (RLL) codes 205
3.8.7 PR signalling 207
3.9 Scrambling 216
3.9.1 PRBS generation 217
3.9.2 Scrambler systems 221

4 Digital filters 225
4.1 Discrete-time linear systems 226
4.1.1 Discrete convolution 228
4.1.2 Filter transfer function 229
4.1.3 Filter stability 230
4.1.4 Filter frequency response 232
4.1.5 Linear phase filters 234
4.2 Filter realization 239
4.2.1 Recursive structures 239
4.2.2 Non-recursive structures 243
4.2.3 Computation considerations 245
4.3 IIR filter design 249
4.3.1 Pole-zero placement method 249
4.3.2 Bilinear transform method 256
4.4 FIR filter design 266
4.4.1 The ideal lowpass filter 266
4.4.2 Frequency sampling method 268
4.4.3 Windowing method 272
4.4.4 Equiripple method 280
4.5 Computation efficient FIR filters 285
4.5.1 Half-band FIR filters 285
4.5.2 RRS structures 286
4.5.3 Prefilter–equalizer design 288
4.5.4 Multiplier-less design 291
4.6 Adaptive filters 294
4.6.1 Wiener filtering 297
4.6.2 The LMS algorithm 298
4.6.3 Adaptive prediction 302
4.6.4 Adaptive equalization 305
4.7 Finite wordlength effects 308
4.7.1 Input quantization 308
4.7.2 Coefficient quantization 309
4.7.3 Product roundoff noise 310

Table of Contents
More information

4.8 Filters for image processing 317
4.8.1 Filtering in different dimensions 317
4.8.2 $N \times N$ convolution 321
4.8.3 Non-linear filters 328

5 Discrete transforms 332
5.1 *N*th-order linear transforms 332
5.2 The discrete Fourier transform (DFT) 337
5.3 The fast Fourier transform (FFT) 341
5.3.1 Decimation in time (DIT) 341
5.3.2 Decimation in frequency (DIF) 344
5.3.3 FFT speed advantage 345
5.3.4 Inverse FFT (IFFT) 346
5.3.5 A real input FFT 348
5.4 FFT realization 349
5.4.1 Butterfly computation 349
5.4.2 Dedicated FFT processors 351
5.4.3 A DSP-chip based FFT processor 355
5.5 FFT spectral estimation 360
5.5.1 Analysis range 360
5.5.2 Self-windowing inputs 362
5.5.3 Spectral leakage 365
5.5.4 Zero extension 368
5.5.5 Windowing to reduce spectral leakage 371
5.5.6 Spectral resolution 375
5.5.7 Power spectrum estimation 377
5.6 Fast convolution and correlation 383
5.6.1 Circular convolution 383
5.6.2 Circular correlation 387
5.7 A fast DCT algorithm 391
5.8 Image transforms 393
5.8.1 2-D FFT 393
5.8.2 2-D DCT 394

Problems 398
Appendix A *Transposition of digital filters using signal flow graphs* 407
Appendix B *Fixed-point arithmetic* 410
Appendix C *C-routine for FIR filter design* 415
Appendix D *C-routine for DIT in-place radix-2 FFT* 417
Appendix E *C-routine for Meggitt decoder simulation* 419
