Preface *page* xi
Acknowledgments xiv

Part I: Creativity in invention and design: issues and ingredients

1 *Creativity, invention, and the computational metaphor* 3
The significance of philosophy of science 4
Creativity in the sciences of the artificial 6
The relevance of computer science 9
The case study approach 11
The invention of microprogramming: as a case study 12
The concept of creativity 15
The relevance of nonpsychological factors 22
The invention of microprogramming: as a creative act 24
Metaphors as explanatory models 27
Metaphors as explanations of creativity 33
Computation as metaphor for the explanation of creativity 35
On the testability of a theory of creativity 39
The broad picture: a summary 43
Notes 44

2 *A computational theory of scientific creativity* 51
Multiple description levels 51
The knowledge level 55
A computational theory of scientific creativity: the hypothesis 60
The explanatory nature of the computational theory 62
The testability of the computational theory 62
Notes 63

Table of Contents
More information

3 *Maurice Wilkes and the origins of microprogramming: the historical setting* 65
The EDSAC and its control circuits 66
On the conceptual nature of Wilkes's problem 69
Representing knowledge: networks and rules 71
The EDSAC and its diode matrix 75
The Whirlwind and its control matrix 78
The emergence of the microprogramming principle 80
The immediate aftermath 83
Notes 84

Part II: The invention of microprogramming: a cognitive explanation

4 *Prolegomenon* 91
A miniexample of a knowledge-level process 94
Spreading activation 100
Summary 101
Notes 102

5 *The genesis of an idea: creating the initial sketch* 103
Problem recognition and formulation 103
The idea of a diode matrix 111
Identifying a stored program computer-like form 117
Deriving the broad principle of microprogramming 119
Notes 123

6 *The evolution of an idea: from initial sketch to mature form* 125
Relating the microprogram and diode matrix ideas 125
A diode matrix representation of the microprogram 136
Diode matrix representation of next micro-order addresses 156
Coupling the diode matrices 168
The problem of alternative successor addresses 173
Notes 181

PART III: Reflections on the nature of inventing

7 *Eight hypotheses about the nature of inventing* 189
Invention as a goal-directed endeavor 190
Goals as working hypotheses in inventive design 191
The gradualistic nature of an insight 192

Subrata Dasgupta
Table of Contents
More information

On the mechanics of "bisociation" or the combining of ideas 194
The role of logic and reasoning in acts of creation 196
On the richness and quality of the knowledge body 201
On an assumption concerning the retrieval of knowledge 206
The eight hypotheses 208
Notes 211

8 *Epilogue* 213

Appendix 217
Table A: Inference rules 217
Table B: Facts 219
Table C: Noninference rules 222
Table D: Goals 230
