<i>Preface</i>	ix
CHAPTER ONE Jay M. Pasachoff	
Observing the farthest things in the Universe	1
Measuring distances in the Universe	1
The expansion of the Universe	8
Hubble's law and the age of the Universe	11
Far away in the Universe	12
New techniques and instrumentation	15
New technology telescopes	17
Telescopes in space	22
CHAPTER TWO Ed Cheng	
The cosmic background radiation	25
How far is far?	26
How do we measure distances?	28
How do distance and age relate?	33
What physical conditions characterize the very young universe?	34
What do we expect to see?	37
What do we see?	40
How do we see it?	49
How do we make these observations credible, and how do they relate to other observations?	52

Table of Contents

[More information](#)

CONTENTS

Can we look farther than the surface of last scattering?	54
What happened before the Big Bang and what is at distances far greater than the Hubble distance?	54
Epilogue	55
CHAPTER THREE Patrick S. Osmer	
Quasars	57
Discovering quasars	58
Quasars as extraordinary objects	59
Quasars as probes of the Universe	61
The evolution of quasars	62
Finding distant quasars	65
The space density of distant quasars	71
CHAPTER FOUR Hyron Spinrad	
Galaxies at the limit: the epoch of galaxy formation	77
Observing distant galaxies	78
Modern methods for faint radio galaxy observation	80
More on the most-distant galaxies	84
Photometric evolutionary models of galaxies	91
Extrinsic intervening matter – modulation of the distant galaxy spectrum	93
Cosmology with distant radio galaxies in the near infrared	94
<i>References and related reading</i>	97
<i>Index</i>	101
