Elliott Sober is a leading philosopher of science and is a winner of the Lakatos Prize, the major award in the field. This new collection of essays will appeal to a readership that extends well beyond the frontiers of the philosophy of science. Sober shows how ideas in evolutionary biology bear in significant ways on traditional problems in philosophy of mind and language, epistemology, and metaphysics. Among the topics addressed are psychological egoism, solipsism, the interpretation of belief and utterance, empiricism, Ockham’s razor, causality, essentialism, and scientific laws.

Sober’s collection is informed by the twin beliefs that the contents of biological theories speak to problems that first saw the light of day as problems in philosophy, and that biological theories provide philosophically interesting examples of how the enterprise of knowledge proceeds. By demonstrating how a philosopher has come to understand philosophical problems by understanding scientific problems and thus how these two worlds of inquiry are interrelated, this volume is paradigmatic of the broader goals of this series.

The collection will prove invaluable to a wide range of philosophers, primarily those working in the philosophy of science, the philosophy of mind, and epistemology.

Jonathan Hodge University of Leeds
Jane Maienschein Arizona State University
Jesus Mosterin University of Barcelona
Elliott Sober University of Wisconsin

This major new series will publish the very best work in the philosophy of biology. Nonsectarian in character, the series will extend across the broadest range of topics: evolutionary theory, population genetics, molecular biology, ecology, human biology, systematics, and more. A special welcome will be given to contributions treating significant advances in biological theory and practice, such as those emerging from the Human Genome Project. At the same time, due emphasis will be given to the historical context of the subject, and there will be an important place for projects that support philosophical claims with historical case studies.

Books in the series will be genuinely interdisciplinary, aimed at a broad cross section of philosophers and biologists, as well as interested scholars in related disciplines. They will include specialist monographs, collaborative volumes, and – in a few instances – selected papers by a single author.
