List of illustrations *ix*  
 List of tables *xii*  
 Preface *xiii*  
 Acknowledgments *xv*

## 1 Climate history of the Earth and background concepts 1

- Rationale 1
- Evolution of the Earth's climate 2
- Climate differences amongst Earth, Mars and Venus 3
- Planetary 'greenhouse' 4
- The climate record of the Earth 4
- The nature of present records of climate change 5  
*Trends and variability, Coherence, Extremes, Probability of exceedence, Persistence and feedback, Serial correlation, lags and response times, Cycles, Chaos theory, Random or stochastic effects*

## Part I: PROCESSES

## 2 Climatic processes 17

- Elements of the sun 17  
*The solar spectrum, Sunspots and solar flares*
- Solar radiation intercepted by the Earth 19
- Attributes of the Earth–atmosphere system 20  
*Orbital effects, Composition of the atmosphere*
- Effect of the atmosphere and Earth's surface 23  
*Absorption, Scattering, Reflectance (albedo)*
- Global radiation budget 26
- Time- and space-averaged radiation budget effects 28
- Concluding comments 30

## 3 Scales of heat and mass transfers in the atmosphere 33

- Basic transfers 33
- Coriolis force, vorticity and Rossby waves 33
- The Palmén–Newton model of general air circulation 36
- Secondary features of atmospheric circulation 40  
*Fronts, Tropical cyclones, Extratropical cyclones, East coast lows, Monsoons*
- Concept of mobile polar highs 46
- Computer generated circulation models 48
- Regional circulation patterns 50  
*North America, Europe, Australia*
- Urban climates 53
- Concluding comments 56

## 4 The role of oceans 58

- Ocean climate processes 58  
*Thermal expansion, Climatic controls and salinity sinks, Ekman transport, Atmosphere–ocean feedbacks*
- Global currents 62
- Gyres, eddies, pools and rings 64
- Scale and response time of the atmosphere and ocean 65
- The Southern Oscillation 66  
*Normal circulation, El Niño–Southern Oscillation (ENSO) events, La Niña events*
- Concluding comments 72

vi • Contents

Part II: CHANGE

5 Scales of climate change: Pleistocene to modern 77

- The Pleistocene Ice Ages 77
- Evidence of Pleistocene climate fluctuations 77  
*Dating techniques, The  $\delta^{18}\text{O}$  deep sea record, The Pleistocene record inferred from geomorphic evidence*
- Late Pleistocene climate 80  
*The recent  $\delta^{18}\text{O}$  record, Noise, 'flickerings' and Dansgaard–Oeschger oscillations, Heinrich iceberg events, The Ice Age temperature paradox of the tropics, Ice Age general atmospheric circulation, Deglaciation, The Younger Dryas*
- Holocene climate 89
- The historic record 90
- The measured record 91  
*Temperatures, Precipitation*
- Concluding comments 94

6 Causes of climate change 97

- Introduction 97
- External factors 97  
*Changes in the sun's orbit within our galaxy, Comets, Changes in solar output (Simpson's theory), Changes in orbital parameters (Milankovitch hypothesis)*
- Geological factors 101  
*Continental drift, Mountain building, Volcanism, Geomagnetism*
- Land–ocean–atmosphere system 106  
*Carbon dioxide and methane changes, Ocean heating and cooling, Albedo changes in ice, snow and dust, Antarctic icesheet surges (Wilson's theory), North Atlantic thermohaline sink, The freezing and thawing of the Arctic, Sea-level as a trigger for deglaciation, The role of dimethylsulphides and cloudiness, Iron enrichment of the oceans*
- Stochastic resonance 111
- Cycles and the historic record 111  
*Sunspot cycles, Sunspots and the Quasi-Biennial Oscillation, Astronomical cycles and worldwide drought and rainfall*
- Concluding comments 114

7 Human effects on climate 117

- Introduction 117
- Enhanced 'greenhouse' warming 117  
*Discovery, Mechanisms, Anthropogenic 'greenhouse' gases, Uncertainties, Missing carbon dioxide*
- Uncertainties about the global warming of the past century 123  
*Description of temperature changes, The bias of surface temperature records, Solar activity versus 'greenhouse' warming, But are temperatures warming?, The role of clouds, The role of sulphate aerosols, The role of dust*
- Models of 'greenhouse'-warmed climate 132  
*General circulation using computer models, General circulation using analogues*
- Caveats on enhanced 'greenhouse' warming 140
- Ozone depletion 142
- 'Nuclear winter' 145
- Concluding comments 147

Part III: IMPACTS

8 Health impacts of climate change 153

- World perspective 153  
*World demography, Global projections, Marginalisation*
- Health and climate change 155  
*Definition of human health, History of disease, Historical effects of climate change, Climate change and crime, Physiological stress, Vector-borne disease, Water-borne diseases, Respiratory diseases*
- Climate-induced natural hazards and health 167  
*Floods, Drought, Bushfire, Preparedness and the consequences of more disasters*
- Effect of ozone depletion 169  
*Effects on UV radiation amounts, UV radiation and the skin, UV radiation and the eye, UV radiation and immunity, Australia as a case study*
- Uncertainties 174  
*Reappearance of old diseases, New diseases*
- Concluding comments 177

9 Ecosystem impacts of climate change	182	10 Epilogue	199
• Present distribution of biome types	182	• Relative importance of changes in atmospheric radiative forcing	199
• Modelling the effect of climate on ecosystems	183	• Perspective on feedback processes favouring Ice Ages	201
• Effect of enhanced 'greenhouse' warming on plants	186		
• Effect of ozone depletion on plants	190		
• Ecosystem change related to climate	191	Index	204
<i>Past record, Future change</i>			
• Effect of ecosystems on climate	195		
• Concluding comments	196
