<i>Preface</i>	<i>page xv</i>
<i>Acknowledgments</i>	xvii
1 Introduction to Fed-Batch Cultures	1
1.1 Batch Cultures	1
1.2 Continuous Cultures	2
1.3 Fed-Batch Cultures	2
1.3.1 Reasons for Fed-Batch Cultures	3
1.3.2 Applications of Fed-Batch Cultures	3
1.3.3 A Simple Example of a Fed-Batch Culture	4
1.4 Alternatives to Fed-Batch Cultures	6
2 Idealized Reactors and Fed-Batch Reactors	19
2.1 Material Balances	19
2.2 Various Types of Ideal Reactors	21
2.2.1 Batch Reactor Operation	21
2.2.2 Continuous-Flow Reactor Operation	23
2.2.3 Semi-Batch Reactor Operation	29
2.2.4 Fed-Batch Cultures	30
3 Maximization of Reaction Rates and Fed-Batch Operation	33
3.1 Intuitive Maximization of a Single Reaction Rate	33
3.1.1 Optimum One-Reactor Operations	35
3.1.2 Optimum Two-Reactor Operations	39
3.1.3 One-Reactor Operation Mimicking a Two-Reactor Operation	40
3.1.4 Rationale for Mimicking Optimal Two-Reactor Operations	43
3.2 Optimization of Multiple Reactions	44
3.2.1 Case of Constant Yields	45
3.2.2 Case of Variable Yields	46
3.3 Maximization of Cell Mass of a Simple Microbial Fed-Batch Culture	47

3.3.1	Feed Rate to Maintain the Substrate Concentration That Maximizes the Specific Growth Rate, $S = S_m$	48
3.3.2	Optimal Feed Rate Sequence for a Fed-Batch Culture	50
4	Phenomena That Favor Fed-Batch Operations	52
4.1	Chemical Phenomena	53
4.1.1	Substrate Inhibition	53
4.1.2	Glucose (Crabtree) Effect	53
4.1.3	Catabolite Repression	53
4.1.4	Utilization of Auxotrophic Mutants	54
4.2	Physical Phenomena	54
4.2.1	High Cell Density	54
4.2.2	Extension of Operational Period	55
4.2.3	Alleviation of High Broth Viscosity	55
4.2.4	Makeup for Lost Water by Evaporation	55
4.2.5	Better Plasmid Stability of Recombinant Cells	55
4.3	Other Phenomena	56
4.3.1	Experimental Kinetic Studies	56
4.3.2	Various Other Situations	56
5	Classification and Characteristics of Fed-Batch Cultures	62
5.1	Classification Based on Feeding Patterns	62
5.1.1	Mass Balance Equations	63
5.1.2	Cell Mass Balance	63
5.1.3	Substrate Balance	63
5.1.4	Product Balance	63
5.1.5	Overall Mass Balance	64
5.1.6	Fed-Batch Cultures with Constant Feed Rates	64
5.1.7	Fed-Batch Cultures with Linearly Varying Feed Rates	73
5.1.8	Fed-Batch Cultures with Exponential Feed Rates	75
5.1.9	Extended Fed-Batch Cultures	79
5.1.10	Fed-Batch Cultures with Intermittent Feed Rates	81
5.1.11	Fed-Batch Cultures with Empirical Feed Rates	82
5.1.12	Fed-Batch Cultures with Optimal Feed Rates	82
5.2	Classification Based on Number of Operational Cycles	82
5.2.1	Single-Cycle Operations	82
5.2.2	Multiple-Cycle Operations, Repeated Fed-Batch Operations	83
6	Models Based on Mass Balance Equations	85
6.1	Mass Balance Equations	86
6.1.1	Total Mass Balance Equation	87
6.1.2	Component Mass Balances	87
6.2	Unstructured Models	89
6.2.1	Specific Growth Rate of Cells, μ	90
6.2.2	Specific Product Formation Rate, π	97
6.2.3	Specific Substrate Consumption Rate, σ	100

<i>Contents</i>	xi
6.2.4 Net Specific Rates	100
6.2.5 Temperature and pH Effects on Specific Rates	101
6.2.6 Maintenance Term	102
6.3 Structured Models	104
6.4 Parameter Estimation	106
6.4.1 All State Variables Are Measurable	106
6.4.2 Some State Variables Are Not Measurable but Are Observable	109
APPENDIX: SOME MODELS PROPOSED IN LITERATURE	112
7 Non-Equation-Based Models	121
7.1 Neural Networks	121
7.1.1 Basic Architecture of Neural Networks	122
7.1.2 Back-Propagation Training Algorithm	123
7.2 Neural Networks in Fed-Batch Fermentation	126
7.2.1 Yeast Fed-Batch Fermentation	127
7.2.2 Hybrid Neural Networks	128
8 Specific Rate Determination	135
8.1 Determination of Specific Rates by Classical Methods	135
8.1.1 Specific Rates by Shake Flask Cultures	136
8.1.2 Specific Rates by Batch Cultures	139
8.1.3 Specific Rates by Continuous Cultures	142
8.1.4 Specific Rates by Fed-Batch Cultures	144
8.2 A New Method of Determining Specific Rates Using Fed-Batch Cultures	144
8.2.1 Constant-Feed Fed-Batch Cultures	145
8.2.2 Utilization of Quasi Steady State	155
APPENDIX: EQUAL-AREA GRAPHICAL DIFFERENTIATION OF DISCRETE EXPERIMENTAL DATA	156
9 Optimization by Pontryagin's Maximum Principle	158
9.1 Impulse and Parameter Optimizations	158
9.2 Optimization Criteria	159
9.2.1 Performance Indices	160
9.2.2 Free and Fixed Final Times	161
9.2.3 Free and Fixed Initial and Final States	161
9.2.4 Various Constraints	162
9.3 Choice of Manipulated Variables	162
9.4 Feed Rate Problem Formulation and Solution	163
9.4.1 Pontryagin's Maximum Principle	164
9.4.2 Boundary Conditions on Adjoint Variables	167
9.4.3 Hamiltonian	168
9.5 Handling of Problems in Nonstandard Forms	172
9.5.1 Nonautonomous Processes	172
9.5.2 Performance Indices Depend Explicitly on the Final Time	172

9.5.3	Other Forms of Performance Index	173
9.5.4	Constraints on State Variables	173
9.5.5	Constraints on Control Variables	174
9.6	Optimization of Initial Conditions	174
9.7	Generalized Legendre–Clebsch Condition	175
9.8	Transformation to Nonsingular Problem	175
9.8.1	Transformation of Singular Problems into Nonsingular Problems	176
9.8.2	Substrate Concentration as Single Manipulated Variable	178
9.8.3	Singular Problems with Multiple Manipulated Variables	180
10	Computational Techniques	186
10.1	Computational Techniques for Processes with Known Mathematical Models	186
10.1.1	Boundary Condition Iterations (Simple Shooting Method)	187
10.1.2	Multiple Shooting Method	189
10.1.3	Control Vector Iterations	189
10.1.4	Nonlinear Programming	193
10.1.5	A Special Transformation to Convert Singular to Nonsingular Problems	198
10.2	Numerical Techniques for Processes without Mathematical Models	201
10.2.1	Neural Network	201
10.2.2	Genetic Algorithm	202
11	Optimization of Single and Multiple Reactions	207
11.1	Single Reactions with a Single Feed Rate	207
11.1.1	Optimal Feed Rate Profile	210
11.2	Single Reactions with Both Feed and Withdrawal Rates	211
11.2.1	Solution via Pontryagin’s Maximum Principle	212
11.2.2	Switching Space Analyses	213
11.2.3	Modal Analyses	215
11.2.4	Feasible Modes	215
11.2.5	Optimal Policies	217
11.3	Optimization of Multiple Reactions with a Feed Rate	222
11.3.1	Constant Yields	223
11.3.2	Variable Yields	224
12	Optimization for Cell Mass Production	227
12.1	Optimization by Pontryagin’s Maximum Principle	227
12.2	Maximization of Cell Mass at Fixed and Free Final Times	228
12.2.1	Problem Formulation	228
12.2.2	Solution by Pontryagin’s Maximum Principle	230
12.2.3	Constant-Yield Coefficients	232
12.2.4	Effects of Operating Parameters	244

	<i>Contents</i>	<i>xiii</i>
12.2.5	Variable-Yield Coefficients	250
12.2.6	Assessment of Singular Regions	263
12.2.7	Singular Regions Characterized by Kinetic Parameters, $\mu(S)$ and $Y_{X/S}(S)$	267
12.3	Maximization of Cellular Productivity, $X(t_f)V(t_f)/t_f$	271
12.3.1	Constant Cell Mass Yield Coefficient	272
12.3.2	Variable Cell Mass Yield Coefficient	277
12.4	Cell Mass Productivity Maximization through Time Optimal Formulation	282
12.4.1	Constant Cell Mass Yield Coefficient and Fixed Final Conditions	283
12.4.2	Variable Cell Mass Yield Coefficient and Fixed Final Conditions	289
12.5	Specific Rates as Functions of Substrate and Cell Concentrations	292
12.5.1	Optimal Feed Rate	292
12.5.2	Constant Cell Mass Yield Coefficient, $Y_{X/S}$	294
12.5.3	Free Final Time, t_f	294
13	Optimization for Metabolite Production	298
13.1	Product Formation Models	298
13.2	General Optimization Problem for Metabolites	299
13.2.1	Choice of Manipulated Variables	299
13.2.2	Substrate Feed Rate as Manipulated Variable	300
13.2.3	Optimization Problem Formulation	300
13.3	Necessary Conditions for Optimality for Metabolite Production	302
13.3.1	Hamiltonian and Adjoint Vector	302
13.3.2	Optimal Feed Rate for Boundary Arc, $x_3(t) = V_{\max}$	304
13.3.3	Optimal Feed Rate for Interior Singular Arc, $x_3(t) < V_{\max}$	304
13.4	Substrate Concentration–Dependent Specific Rates	305
13.4.1	Constant-Yield Coefficients and No Maintenance Requirement	306
13.4.2	Variable-Yield Coefficients and Maintenance Requirement	325
13.5	Substrate and Product Concentration–Dependent Specific Rates, $\mu(S, P)$, $\pi(S, P)$, and $\sigma(S, P)$	340
13.6	Recombinant Cell Products	345
13.6.1	Recombinant Cells with Plasmid Instability	345
13.6.2	Recombinant Cells with Plasmid Instability and Subject to Cell Death	365
13.7	Higher-Order Models	377
13.7.1	Animal Cell Cultures	377
13.7.2	Transformation of Singular Problems to Nonsingular Problems	381
13.7.3	Transformation of Singular Problems with Multiple Feed Rates	385

14 Simple Adaptive Optimization	393
14.1 Off-Line Cycle-to-Cycle (Sequential) Optimization	394
14.1.1 Off-Line Cycle-to-Cycle Optimization of Penicillin Production	395
14.1.2 Experimental Off-Line Cycle-to-Cycle Optimization of Invertase Production	399
14.2 On-Line Adaptive Optimization	402
14.2.1 Simulation Studies of On-Line Adaptive Optimization of Penicillin Production	403
14.2.2 Experimental On-Line Adaptive Optimization of Invertase Production	404
15 Measurements, Estimation, and Control	407
15.1 Measurements of Process Variables and Parameters	408
15.1.1 Physical Properties	408
15.1.2 Chemical Properties	409
15.1.3 Culture Conditions	412
15.2 Estimation Techniques	413
15.2.1 Macroscopic Balances	414
15.2.2 Mathematical Estimation Techniques	416
15.3 Feedback Control Systems	420
15.3.1 Single-Loop Control	423
15.3.2 Controller Selection and Tuning Methods	425
15.3.3 Multiple-Loop Control	427
15.4 Indirect Feedback Control	430
15.4.1 Carbon Dioxide Evolution Rate	430
15.4.2 Specific Growth Rates	431
15.5 Optimal Control	431
15.5.1 Optimal Open-Loop Control	432
15.5.2 Optimal Closed-Loop (Feedback) Control	432
16 Feasibility Assessment and Implementable Feed Rates	437
16.1 Estimation of Specific Rates	438
16.1.1 Shake-Flask and Batch Experiments	438
16.1.2 Fed-Batch Operations	439
16.2 Sequential Approach to Feasibility Assessment	440
16.3 Implementable Optimal–Suboptimal Feed Rates	443
16.3.1 Cell Mass as Product	443
16.3.2 Metabolites as Product	447
16.3.3 Recombinant Cell Products	451
<i>Index</i>	453
