

Handbook of Functional MRI Data Analysis

Functional magnetic resonance imaging (fMRI) has become the most popular method for imaging brain function. *Handbook of Functional MRI Data Analysis* provides a comprehensive and practical introduction to the methods used for fMRI data analysis. Using minimal jargon, this book explains the concepts behind processing fMRI data, focusing on the techniques that are most commonly used in the field. This book provides background about the methods employed by common data analysis packages including FSL, SPM, and AFNI. Some of the newest cutting-edge techniques, including pattern classification analysis, connectivity modeling, and resting state network analysis, are also discussed.

Readers of this book, whether newcomers to the field or experienced researchers, will obtain a deep and effective knowledge of how to employ fMRI analysis to ask scientific questions and become more sophisticated users of fMRI analysis software.

Dr. Russell A. Poldrack is the director of the Imaging Research Center and professor of Psychology and Neurobiology at the University of Texas at Austin. He has published more than 100 articles in the field of cognitive neuroscience, in journals including *Science*, *Nature*, *Neuron*, *Nature Neuroscience*, and *PNAS*. He is well known for his writings on how neuroimaging can be used to make inferences about psychological function, as well as for his research using fMRI and other imaging techniques to understand the brain systems that support learning and memory, decision making, and executive function.

Dr. Jeanette A. Mumford is a research assistant professor in the Department of Psychology at the University of Texas at Austin. Trained in biostatistics, her research has focused on the development and characterization of new methods for statistical modeling and analysis of fMRI data. Her work has examined the impact of different group modeling strategies and developed new tools for modeling network structure in resting-state fMRI data. She is the developer of the fmriPower software package, which provides power analysis tools for fMRI data.

Dr. Thomas E. Nichols is the head of Neuroimaging Statistics at the University of Warwick, United Kingdom. He has been working in functional neuroimaging since 1992, when he joined the University of Pittsburgh's PET facility as programmer and statistician. He is known for his work on inference in brain imaging, using both parametric and nonparametric methods, and he is an active contributor to the FSL and SPM software packages. In 2009 he received the Wiley Young Investigator Award from the Organization for Human Brain Mapping in recognition for his contributions to statistical modeling and inference of neuroimaging data.

Contents

<i>Preface</i>	<i>page ix</i>
1 Introduction	1
1.1 A brief overview of fMRI	1
1.2 The emergence of cognitive neuroscience	3
1.3 A brief history of fMRI analysis	4
1.4 Major components of fMRI analysis	7
1.5 Software packages for fMRI analysis	7
1.6 Choosing a software package	10
1.7 Overview of processing streams	10
1.8 Prerequisites for fMRI analysis	10
2 Image processing basics	13
2.1 What is an image?	13
2.2 Coordinate systems	15
2.3 Spatial transformations	17
2.4 Filtering and Fourier analysis	31
3 Preprocessing fMRI data	34
3.1 Introduction	34
3.2 An overview of fMRI preprocessing	34
3.3 Quality control techniques	34
3.4 Distortion correction	38
3.5 Slice timing correction	41
3.6 Motion correction	43
3.7 Spatial smoothing	50
4 Spatial normalization	53
4.1 Introduction	53
4.2 Anatomical variability	53

4.3	Coordinate spaces for neuroimaging	54
4.4	Atlases and templates	55
4.5	Preprocessing of anatomical images	56
4.6	Processing streams for fMRI normalization	58
4.7	Spatial normalization methods	60
4.8	Surface-based methods	62
4.9	Choosing a spatial normalization method	63
4.10	Quality control for spatial normalization	65
4.11	Troubleshooting normalization problems	66
4.12	Normalizing data from special populations	66
5	Statistical modeling: Single subject analysis	70
5.1	The BOLD signal	70
5.2	The BOLD noise	86
5.3	Study design and modeling strategies	92
6	Statistical modeling: Group analysis	100
6.1	The mixed effects model	100
6.2	Mean centering continuous covariates	105
7	Statistical inference on images	110
7.1	Basics of statistical inference	110
7.2	Features of interest in images	112
7.3	The multiple testing problem and solutions	116
7.4	Combining inferences: masking and conjunctions	123
7.5	Use of region of interest masks	126
7.6	Computing statistical power	126
8	Modeling brain connectivity	130
8.1	Introduction	130
8.2	Functional connectivity	131
8.3	Effective connectivity	144
8.4	Network analysis and graph theory	155
9	Multivoxel pattern analysis and machine learning	160
9.1	Introduction to pattern classification	160
9.2	Applying classifiers to fMRI data	163
9.3	Data extraction	163
9.4	Feature selection	164
9.5	Training and testing the classifier	165
9.6	Characterizing the classifier	171
10	Visualizing, localizing, and reporting fMRI data	173
10.1	Visualizing activation data	173
10.2	Localizing activation	176

10.3 Localizing and reporting activation	179
10.4 Region of interest analysis	183
Appendix A Review of the General Linear Model	191
A.1 Estimating GLM parameters	191
A.2 Hypothesis testing	194
A.3 Correlation and heterogeneous variances	195
A.4 Why “general” linear model?	197
Appendix B Data organization and management	201
B.1 Computing for fMRI analysis	201
B.2 Data organization	202
B.3 Project management	204
B.4 Scripting for data analysis	205
Appendix C Image formats	208
C.1 Data storage	208
C.2 File formats	209
<i>Bibliography</i>	211
<i>Index</i>	225

Preface

Functional magnetic resonance imaging (fMRI) has, in less than two decades, become the most commonly used method for the study of human brain function. fMRI is a technique that uses magnetic resonance imaging to measure brain activity by measuring changes in the local oxygenation of blood, which in turn reflects the amount of local brain activity. The analysis of fMRI data is exceedingly complex, requiring the use of sophisticated techniques from signal and image processing and statistics in order to go from the raw data to the finished product, which is generally a statistical map showing which brain regions responded to some particular manipulation of mental or perceptual functions. There are now several software packages available for the processing and analysis of fMRI data, several of which are freely available.

The purpose of this book is to provide researchers with a sophisticated understanding of all of the techniques necessary for processing and analysis of fMRI data. The content is organized roughly in line with the standard flow of data processing operations, or processing stream, used in fMRI data analysis. After starting with a general introduction to fMRI, the chapters walk through all the steps that one takes in analyzing an fMRI dataset. We begin with an overview of basic image processing methods, providing an introduction to the kinds of data that are used in fMRI and how they can be transformed and filtered. We then discuss the many steps that are used for preprocessing fMRI data, including quality control, correction for various kinds of artifacts, and spatial smoothing, followed by a description of methods for spatial normalization, which is the warping of data into a common anatomical space. The next three chapters then discuss the heart of fMRI data analysis, which is statistical modeling and inference. We separately discuss modeling data from fMRI timeseries within an individual and modeling group data across individuals, followed by an outline of methods for statistical inference that focuses on the severe multiple test problem that is inherent in fMRI data. Two additional chapters focus on methods for analyzing data that go beyond a single voxel, involving either the

x **Preface**

modeling of connectivity between regions or the use of machine learning techniques to model multivariate patterns in the data. The final chapter discusses approaches for the visualization of the complex data that come out of fMRI analysis. The appendices provide background about the general linear model, a practical guide to the organization of fMRI data, and an introduction to imaging data file formats.

The intended audience for this book is individuals who want to understand fMRI analysis at a deep conceptual level, rather than simply knowing which buttons to push on the software package. This may include graduate students and advanced undergraduate students, medical school students, and researchers in a broad range of fields including psychology, neuroscience, radiology, neurology, statistics, and bioinformatics. The book could be used in a number of types of courses, including graduate and advanced undergraduate courses on neuroimaging as well as more focused courses on fMRI data analysis.

We have attempted to explain the concepts in this book with a minimal amount of mathematical notation. Some of the chapters include mathematical detail about particular techniques, but this can generally be skipped without harm, though interested readers will find that understanding the mathematics can provide additional insight. The reader is assumed to have a basic knowledge of statistics and linear algebra, but we also provide background for the reader in these topics, particularly with regard to the general linear model.

We believe that the only way to really learn about fMRI analysis is to do it. To that end, we have provided the example datasets used in the book along with example analysis scripts on the book's Web site: <http://www.fmri-data-analysis.org/>.

Although our examples focus primarily on the FSL and SPM software packages, we welcome developers and users of other packages to submit example scripts that demonstrate how to analyze the data using those other packages. Another great way to learn about fMRI analysis is to simulate data and test out different techniques. To assist the reader in this exercise, we also provide on the Web site examples of code that was used to create a number of the figures in the book. These examples include MATLAB, R, and Python code, highlighting the many different ways in which one can work with fMRI data.

The following people provided helpful comments on various chapters in the book, for which we are very grateful: Akram Bakkour, Michael Chee, Joe Devlin, Marta Garrido, Clark Glymour, Yaroslav Halchenko, Mark Jenkinson, Agatha Lenartowicz, Randy McIntosh, Rajeev Raizada, Antonio Rangel, David Schnyer, and Klaas Enno Stephan. We would also like to thank Lauren Cowles at Cambridge University Press for her guidance and patience throughout the process of creating this book.
