

Index

- anomalous dimensions 108
- asymptotic conservation laws 81
- boundary layer, laminar
 - self-similar solution 96–102
- boundary layer, turbulent
 - scaling laws 152–62
 - structure 155, 160
- breathing rate of animals
 - scaling laws 132–6
- Britain, length of the west coast of 124–5
- Burgers' equation 111
- Burgers' shock wave 111–13
- Chorin's mathematical example, illustrating
 - turbulent shear flow 140–2
- class of systems of units 14–15
- classification of self-similar solutions 87–8
- classification of similarity laws 83–7, 89–90
- cohesion modulus 35
- complete similarity 82, 84–7, 144
- cone crack 34–6
- convection, modelling 45–9
- covariance principle 17, 85
- Darcy's law 53, 78
- dimension 12, 16–20, 23, 26–31, 40–3, 46, 50, 55, 92, 95, 98
- dimensional analysis 12, 22–9, 103
 - connection with transformation groups 94–6
 - generalized 101–2
- dimensional analysis, applications to
 - construction of the self-similar solutions 55–60, 65–8, 71–2
 - drag of pipe flows 29–31
 - extension of cone crack 34–6
 - period of pendulum oscillations 26–7
 - proof of Pythagoras theorem 27–8
- experimental asymptotics 87, 150
- explosion, intense 2–9
- filtration–absorption equation 11
- flame 113–16
- fractals 123–9
 - incomplete similarity 129–32
- fractality of respiratory organs 132–6
- fracture toughness 35
- governing parameters 22, 27, 29, 31, 35, 38–40, 42, 43, 46, 50, 91, 92
- generalized homogeneity 24, 84, 85–6, 95, 103, 106
- groundwater flooding, intense 55–65
- groundwater flows 52–5, 65–8, 69–71
 - intense pulse flow 65–8
- implosion, shock wave 9, 10
- impulsive load problem 11
- incomplete similarity 85–7, 102–6, 145
- independent dimensions 20, 30
- intense explosion 2–9
- intense groundwater flooding 55–65
- intense groundwater pulse flow 65–68
- intense implosion 9–11
- intermediate asymptotics 9, 60–5, 68, 72–81, 112, 115
- Izaksón–Millikan–von Mises
 - derivation of the velocity distribution in turbulent shear flow 150–1
 - modification of derivation 151–3

- Korteweg–de Vries equation
 - solitary wave solutions 119–20
- Lewis–von Elbe similarity law 114
- logarithmic law, universal 144
- modelling of
 - convection 45–8
 - high-velocity motion of body in gas 43
 - motion of body in viscous fluid 39–40
 - motion of row boats 49–50
 - motion of streamlined surface ship 41–2
- models of phenomena 3, 9
- Navier–Stokes equations 96, 137
- nonlinear eigenvalue problem 10, 78–81, 116–19
 - perturbation expansion 106–8
- nuclear explosion 1
 - shock wave 4–7
- pendulum, dimensional analysis of 26–7
- physical similarity
 - choosing the governing parameters 39
 - criteria 38
 - definition 37
 - scaling from model up to prototype 38
- Pythagoras’ theorem
 - proof by dimensional analysis 27–8
- recipe for similarity analysis 91–2
- renormalization group 102–6
- scaling laws 89–93
- self-similarity 7–9, 55–60, 65–8, 71–2
- solitons, self-similar interpretation 122
- systems of units of measurement 13–14
- transformation group 5, 94–6, 100
- travelling waves 109–11
 - connection with self-similar variables 122
- turbulence 137–40
- turbulent shear flow
 - drag law 148–9
 - scaling law 148
- units of measurement 12, 16
- universal form of scaling law for turbulent shear flows 148–9, 158
- universal logarithmic law for turbulent shear flows 144
