The Cambridge Handbook of Multimedia Learning

During the past 10 years, the field of multimedia learning has emerged as a coherent discipline with an accumulated research base that has never been synthesized and organized in a handbook. The Cambridge Handbook of Multimedia Learning constitutes the world’s first handbook devoted to comprehensive coverage of research and theory in the field of multimedia learning. Multimedia learning is defined as learning from words (e.g., spoken or printed text) and pictures (e.g., illustrations, photos, maps, graphs, animation, or video). The focus of this handbook is on how people learn from words and pictures in computer-based environments. Multimedia environments include online instructional presentations, interactive lessons, e-courses, simulation games, virtual reality, and computer-supported in-class presentations. The Cambridge Handbook of Multimedia Learning seeks to establish what works (i.e., to determine which features of a multimedia lesson affect learning), to explain how it works (i.e., to ground research in cognitive theory), and to consider when and where it works (i.e., to explore the implications of research for practice).

Richard E. Mayer is Professor of Psychology at the University of California, Santa Barbara, where he has served since 1975. In 2000, he received the E. L. Thorndike Award for career achievement in educational psychology. He is the author or editor of 20 books and more than 250 articles and chapters, including Multimedia Learning (2001), e-Learning and the Science of Instruction (2003) with Ruth Clark, and Learning and Instruction (2003).
The Cambridge Handbook of Multimedia Learning

Edited by
Richard E. Mayer
University of California, Santa Barbara
Contents

Preface page ix
Contributors xiii

1. Introduction to Multimedia Learning 1
   Richard E. Mayer

PART I
THEORETICAL FOUNDATIONS

2. Implications of Cognitive Load Theory for Multimedia Learning 19
   John Sweller

3. Cognitive Theory of Multimedia Learning 31
   Richard E. Mayer

4. An Integrated Model of Text and Picture Comprehension 49
   Wolfgang Schnotz

5. The Four-Component Instructional Design Model: Multimedia Principles in Environments for Complex Learning 71
   Jeroen J. G. van Merriënboer
   Liesbeth Kester
PART II
BASIC PRINCIPLES OF MULTIMEDIA LEARNING

6. Five Common but Questionable Principles of Multimedia Learning
Richard E. Clark
David F. Feldon

7. The Multimedia Principle
J. D. Fletcher
Sigmund Tobias

8. The Split-Attention Principle in Multimedia Learning
Paul Ayres
John Sweller

9. The Modality Principle in Multimedia Learning
Renae Low
John Sweller

10. The Redundancy Principle in Multimedia Learning
John Sweller

Richard E. Mayer

Richard E. Mayer

Richard E. Mayer

PART III
ADVANCED PRINCIPLES OF MULTIMEDIA LEARNING

14. The Guided Discovery Principle in Multimedia Learning
Ton de Jong

15. The Worked-Out Examples Principle in Multimedia Learning
Alexander Renkl

16. The Collaboration Principle in Multimedia Learning
David H. Jonassen
Chwee Beng Lee
Chia-Chi Yang
James Laffey

During the past 10 years, the field of multimedia learning has emerged as a coherent discipline with an accumulated research base that has never been synthesized and organized in a handbook. The Cambridge Handbook of Multimedia Learning constitutes the world’s first handbook devoted to comprehensive coverage of research and theory in the field of multimedia learning. For purposes of the Handbook, multimedia learning is defined as learning from words (e.g., spoken or printed text) and pictures (e.g., illustrations, photos, maps, graphs, animation, or video). The focus of the Handbook is on how people learn from words and pictures in computer-based environments. Multimedia environments include online instructional presentations, interactive lessons, e-courses, simulation games, virtual reality, and computer-supported in-class presentations. Overall, the Handbook seeks to establish what works (i.e., to determine which features of a multimedia lesson affect learning), to explain how it works (i.e., to ground research in cognitive theory), and to consider when and where it works (i.e., to explore the implications of research for practice).

What distinguishes this book from edited books on distance learning or Web-based instruction is our commitment to taking a scientific, evidence-based approach. My goal as editor is to provide a comprehensive and focused overview of the state of scientific research on multimedia learning. Each chapter is based on empirical research and grounded in cognitive theory, rather than offering unsubstantiated recommendations, describing best practices, or summarizing software development accomplishments. As the first comprehensive research-based handbook on multimedia learning, The Cambridge Handbook of Multimedia Learning is intended to define and shape the field for years to come.

There are many books providing advice on how to design multimedia-learning environments, but these books are largely based on the practical experience and wisdom of the authors. Similarly, there are books reporting on the development of online instructional programs and Web sites, but these reports of development efforts are generally based on best practices and informal case studies. Until recently, the lack of scientific research evidence in many
multimedia-learning books could be justified on the grounds that a solid research base did not yet exist. However, the quantity and quality of scientific research — conducted by researchers around the world — has reached a level warranting the field’s first comprehensive research-based handbook of multimedia learning.

As editor, I asked the world’s leading multimedia researchers to author chapters in areas in which they have contributed to the empirical research base. In particular, I sought authors who are leading researchers in the field of multimedia learning — that is, those with the strongest records of research publication. Because the field is largely international, the chapter authors for the Handbook span the globe. Each chapter author had a specific charge — that is, directions to review a well-defined subarea such as the role of online worked-out examples or the role of speech versus on-screen text. The chapters in each section follow the same general structure: describing the major research issue or question, providing examples of the research issue or question, summarizing research in which measures of learning are the central focus, critiquing the research, and discussing implications for theory and practice.

The Handbook consists of 35 chapters organized into five parts. Each chapter focuses on a particular theory of multimedia learning (part 1), a basic principle of multimedia learning (part 2), an advanced principle of multimedia learning (part 3), multimedia learning in a content area (part 4), or multimedia learning within an advanced computer-based context (part 5). In order to provide a common structure among the chapters of the Handbook, I asked authors to organize their chapters around a common set of issues. In particular, I asked the authors of the theory chapters in part 1 to provide a concise description of the theory or model with concrete examples, to summarize the theory’s contributions to cognitive theory (i.e., to specify predictions that have been tested), to summarize the theory’s contributions to instructional design (i.e., to specify recommendations for instruction), to describe any limitations of the theory, and to suggest future directions for research. I asked the authors of each of the other chapters to provide a clear definition and example of the central principle or topic of the chapter, to review the relevant published research literature in sufficient detail, to assess the limitations of the research base, to summarize the implications for cognitive theory and instructional design, and to suggest directions for future research.

I solicited chapters that were concise (i.e., containing no more than 25 double-spaced pages), focused (i.e., reviewing the research on a specified topic), well-referenced (i.e., containing a rich set of relevant references), evidence-based (i.e., providing an up-to-date review of the best empirical evidence), theory-based (i.e., relating the findings to testable predictions of theories when appropriate), and educationally relevant (i.e., drawing implications for educational practice when appropriate). In order to minimize confusion, I asked authors to clearly define jargon terms in the text as well as in a glossary at the end of the chapter. Each chapter was reviewed and revised.

The intended audience includes anyone interested in how people learn from words and pictures in computer-based environments. Although this handbook summarizes the research base in multimedia learning, it is intended to be accessible to a general audience. On one hand, this handbook is designed to support readers with practical interests in how to design or select multimedia learning environments that promote learning. On the other hand, this handbook is designed to support readers who have academic interests in conducting or evaluating research in multimedia learning. The Handbook would be appropriate for courses related to cognitive science, educational psychology, instructional design, human factors, multimedia arts and technology, professional training, and interface design. It also would be useful for instructors interested in designing or improving multimedia lessons in school settings, job training contexts, and informal environments. In short, The Cambridge Handbook of Multimedia Learning...
belongs on the bookshelf of anyone who is interested in an evidence-based approach to Web-based learning, e-learning, hypermedia, multimedia, Web site design, distance learning, instructional technology, human-computer interaction, virtual environments, or applied cognitive psychology.

As editor, I have tried to ensure that this handbook reflects the values that I think are important for our field. In particular, I sought to produce a handbook that is:

- **research based** – The Handbook is intended to summarize the empirical research on multimedia learning, rather than describe untested best practices or software development projects. Although I have much respect for the craft knowledge of practitioners and designers, it is important to know if recommendations are supported by scientific evidence and under what conditions they are supported. Thus, I value a focus on scientific evidence as the key to progress in our field.

- **theory grounded** – The Handbook is intended to relate empirical research to cognitive theories of how people learn. My overriding premise is that multimedia learning environments should be designed in ways that are consistent with what is known about how people learn.

- **educationally relevant** – The Handbook focuses on issues that are relevant to education, that is, to helping people learn. Thus, I sought chapters that offer research-based implications for instructional design.

- **comprehensive** – The Handbook offers a broad view of the field, including contributions from multimedia researchers around the world. I value the perspectives of researchers who have devoted so much of their energy to understanding multimedia learning.

- **timely** – The Handbook offers an up-to-date overview of the field. I value timeliness because the scientific study of multimedia learning is maturing at a rapid pace, and so are the practical demands for building multimedia learning environments – ranging from e-courses to in-class simulations.

- **readable** – In my role as editor I have tried to ensure that the chapters are clear and concise, with key terms defined and concrete examples provided. In a multidisciplinary field such as this one, it is important that the chapters communicate what is known in a way that general readers can appreciate.

In short, my values have motivated me to seek chapters that are based on empirical research and grounded in cognitive theory rather than chapters that mainly describe development efforts or best practices.

Editing this book has been a treat for me, because I could commission chapters from the best researchers in the field and be the first to learn what they had to say. I am pleased to share the fruits of this enterprise with you in a timely fashion. My hope is that you enjoy reading this handbook as much as I have enjoyed editing it. I will consider this handbook to be a success if it helps you to understand what is known about how people learn from words and pictures; gives you useful help in building or selecting effective multimedia learning environments; or encourages you to produce or investigate research that contributes to cognitive theory and educational practice. I hope that you will feel free to contact me at mayer@psych.ucsb.edu to share your comments about The Cambridge Handbook of Multimedia Learning.

**Acknowledgments**

Although my name is listed as the editor, this handbook depended on the contributions of many people. In particular, I thank the authors for producing excellent chapters, for keeping this project on schedule, and for responding so well to the reviewer’s comments. I thank the members of the handbook’s editorial board – John Sweller, Jeroen van Merriënboer, and
Wolfgang Schnitz – for their useful service to this project. I also wish to thank Philip Laughlin and the staff of Cambridge University Press for their many contributions to making this book a success. I am grateful to my many research collaborators who have worked with me over the years in the study of multimedia learning, including Richard B. Anderson, Robert Atkinson, Julie Campbell, Paul Chandler, Dorothy Chun, Gayle Dow, Joan Gallini, Shannon Harp, Julie Heiser, James Lester, Steven Lonn, Patricia Mautone, Sarah Mayer, Roxana Moreno, Harold O’Neil, Jr., Jan Plass, Hiller Spires, and Valerie Sims. I appreciate my home institution – the University of California, Santa Barbara – and numerous funding agencies – including the National Science Foundation, the Office of Naval Research, and the Andrew Mellon Foundation – that have supported my research on multimedia learning. Finally, my deepest appreciation goes to my wife, Beverly; my children, Ken, David, and Sarah; and to the memory of my parents, James and Bernis Mayer.
