Contents

Acknowledgements	vii
Introduction	1
1 Completely integrable systems	2
2 The Arnold-Liouville theorem	5
3 A discourse on the method	6
4 About this book	11
5 Notation	13
I The rigid body with a fixed point	15
1 The equations	15
2 The question of integrability	18
3 The three-dimensional free rigid body and the Euler-Poinsot case	21
II The symmetric spinning top	27
1 Introduction to the symmetric spinning top	27
2 A Lax pair and what follows	32
III The Kowalevski top	45
1 Kowalevski's method	45
2 Lax pair and spectral curves	52
3 Lax pairs for generalised spinning tops and applications	60
IV The free rigid body	65
1 The Euler and Manakov equations	65
2 The dimension-3 free rigid body	66
3 Remarks on the dimension-4 rigid body	69
V Non-compact levels: a Toda lattice	77
1 The differential system and the spectral curve	77
2 The eigenvector mapping: the $n = 2$ case	83

Contents

Appendices	91
Appendix 1 A Poisson structure on the dual of a Lie algebra	91
Appendix 2 R -matrices and the “AKS theorem”	98
Appendix 3 The eigenvector mapping and linearising flows	104
Appendix 4 Complex curves, real curves and their Jacobians	113
Appendix 5 Prym varieties	124
References	131
Index	137

Among the works in which I have learned the most, there are three papers that I wish to mention here. I think that I was very lucky to start my initiation to integrable systems by reading two very beautiful papers that are not among the most cited, those of Verdier [84] and Griffiths [36]. On the one hand, Verdier had the brilliant idea of illustrating his exposition of the work of Adler and van Moerbeke by the example of the symmetric top. On the other hand, Griffiths' main philosophical point was to look at a Lax equation, without specifying anything more. The advantage of this approach is that it allows one to start working without having first ingested loop algebras and the "AKS theorem". Moreover, in this sober presentation, the role played by the eigenvectors of the Lax matrices is amply brought to light. The algebraic geometry related to these eigenvectors is extremely well described in Reyman's paper [74] – which is the third paper to which I feel indebted.

The present text originates mainly from several talks¹ I have given on the examples here, in particular on the work I have done jointly with R. Silhol [15] and from a graduate course I taught in Strasbourg in 1992-93, jointly with J.-Y. Mérindol, on "Algebraic curves and integrable systems". The first version, *Toupies, un cours sur les systèmes intégrables* was written at the end of 1993. I am very pleased to acknowledge the influence of the very clear survey of Reyman & Semenov-Tian-Shanski [77] on the present version.

I have learned a lot in discussions with Jean-Yves Mérindol, Robert Silhol, and, especially, Alexei Reyman.

A lot of people have helped me to understand the material here, by criticism, questions or simply remarks during a talk, among which are, colleagues or students, Nicole Bopp, Nicole Desolneux-Moulis, Ljubomir Gavrilov, Sophie Gérardy, Bertrand Haas, Patrick Iglesias, Viatcheslav Kharlamov, Dimitri Markushevich, Nguyen Tien Dũng, Nitin Nitsure, Leonid Polterovich, Claude Sabbah, Jean-Marie Strelczyn, Jean Stutzmann and Pol Vanhaecke. I wish to thank them all.

The pictures in this book have been created by Raymond Seroul, whom I am also very pleased to thank.

Michèle Audin
Strasbourg, January 30, 1996

¹I thank all the people who have invited me to give or listened to me giving talks in Basel, Bochum, Bombay, Boston, Cambridge, Haifa, Lausanne, Luminy, Lyon, Montréal, Paris, Nantes, Strasbourg, Tel-Aviv.

Acknowledgements

Last, but not least, I wish to thank the staff of Cambridge University Press, especially David Tranah, who kindly welcomed the book, and Susan Parkinson, who was very helpful in improving the English.
