Preface	xii
List of important symbols	xiv
PART I. PRELUDE	
1 Introduction	1
1.1 Theoretical ...	3
1.1.1 The language	3
1.1.2 The tool	4
1.1.3 The model	6
1.2 ... Ecosystem ecology	6
1.2.1 The problems	7
1.3 Setting a perspective	9
2 Element cycling	12
2.1 Elemental distribution	12
2.2 Carbon and nitrogen	13
PART II. THE SOIL	17
3 Theory for homogeneous substrates	19
3.1 Main concepts	19
3.2 Carbon and nitrogen dynamics	20
3.3 A particular solution	26
3.4 Lag-time effects	29
3.5 From single litter cohorts to the soil	30
4 Theory for heterogeneous substrates	34
4.1 Substrate quality	35
4.2 Basic equations for carbon	35
4.3 Two particular solutions	39
4.4 The moment expansion	42
4.5 Basic equations for N, P and S	45
4.6 One litter cohort	47
4.7 Models for decomposer functions	51
4.8 Model I	52
4.8.1 One litter cohort	52

4.8.2	Several litter cohorts	54
4.9	Model II	55
4.9.1	One litter cohort	57
4.9.2	Several litter cohorts	58
4.10	Comparison with other approaches	59
5	Carbon and nitrogen - applications	61
5.1	Single litter cohorts	61
5.2	Steady state of soil organic matter	68
5.3	Correlation between carbon and nitrogen turnover	70
5.4	Steady state of a Scots pine forest	70
5.5	An agricultural application	72
5.6	Decomposer biomass	73
6	Carbon, nitrogen, phosphorus and sulphur - applications	79
6.1	C-N-P-S interactions	79
6.2	C, P and N dynamics in single litter cohorts	80
6.3	Stabilisation of C, N, P and S in the soil	82
6.4	C, N, P and S mineralisation	85
7	Interactions with abiotic factors	91
7.1	The problems	91
7.2	Mineralisation-immobilisation in single litter cohorts	92
7.3	N retention in the soil organic matter	97
7.4	Perturbation in carbon accessibility	100
7.5	Variable decomposer growth rate	107
PART III. THE PLANT		111
8	Theory for plant growth	113
8.1	Nitrogen productivity	114
8.2	Nitrogen productivity or photosynthesis and respiration	118
8.3	Different uptake models	120
8.3.1	General uptake rate	120
8.3.2	Exponential uptake	124
8.3.3	Fixed amount	126
8.3.4	General uptake rate - revisited	130
8.4	Nitrogen productivity and other nutrients	131
8.5	Variable P_N	133
8.6	Comparison with other approaches	137

Contents

xi

9	Plant growth - applications and extensions	139
9.1	Empirical evidence for nutrient productivities	139
9.1.1	Exponential growth	139
9.1.2	Non-exponential growth	141
9.2	Nitrogen productivity and light	142
9.3	Root:shoot ratios	148
9.4	Nutrient use efficiency and the Piper-Steenbjerg effect	151
9.4.1	Nutrient use efficiency	151
9.4.2	The Piper-Steenbjerg effect	152
PART IV. THE ECOSYSTEM		157
10	Elements of an ecosystem theory	159
10.1	The general terrestrial ecosystem equation	159
10.2	Ecosystem stoichiometry	161
10.3	Comparison with other approaches	164
10.3.1	CENTURY, GEM, G'DAY	165
10.3.2	FORET, LINKAGES	165
10.3.3	MEL	166
11	Ecosystems - applications	167
11.1	Ecosystems and global change	167
11.2	Nitrogen saturation	170
11.3	Short rotation forestry	174
11.4	Other applications	176
11.4.1	Global change - revisited	179
11.4.2	Forest nutrient budgets	180
11.4.3	Acid depositions to forest ecosystems	183
12	Quality - the bridge between plant and soil	186
12.1	Components of quality	186
12.2	Plants and quality	191
Epilogue		193
Appendices		195
A.1	Some properties of the delta function	195
A.2	Numerical solutions to (4.7) and to the moment expansion	196
References		201
Solutions to selected problems		222
Subject index		229
