NON-PERTURBATIVE FIELD THEORY
From Two-Dimensional Conformal Field Theory to QCD in Four Dimensions

Providing a new perspective on quantum field theory, this book gives a pedagogical and up-to-date exposition of non-perturbative methods in relativistic quantum field theory and introduces the reader to modern research work in theoretical physics.

It describes in detail non-perturbative methods in quantum field theory, and explores two-dimensional and four-dimensional gauge dynamics using those methods. The book concludes with a summary emphasizing the interplay between two- and four-dimensional gauge theories.

Aimed at graduate students and researchers, this book covers topics from two-dimensional conformal symmetry, affine Lie algebras, solitons, integrable models, bosonization and ’t Hooft model, to four-dimensional conformal invariance, integrability, large N expansion, Skyrme model, monopoles and instantons. Applications, first to simple field theories and gauge dynamics in two dimensions, and then to gauge theories in four dimensions and quantum chromodynamics (QCD) in particular, are thoroughly described.

YITZHAK FRISHMAN is a Professor Emeritus at the Weizmann Institute, Israel, where he has served as Head of the Einstein Centre for Theoretical Physics and Head of the Department of Particle Physics.

JACOB SONNENSCHEIN is a Professor of Physics at Tel Aviv University, Israel, where he was Head of the Particle Physics Department from 2003 to 2007.

PART I NON-PERTURBATIVE METHODS IN TWO-DIMENSIONAL FIELD THEORY

1 From massless free scalar field to conformal field theories 3
1.1 Complex geometry 3
1.2 Free massless scalar field 4
1.3 Symmetries of the classical action 5
1.4 Mode expansion 6
1.5 Noether currents and charges 7
1.6 Canonical quantization 7
1.7 Radial quantization 9
1.8 Operator product expansion 11
1.9 Path integral quantization 12
1.10 Affine current algebra 13
1.11 Virasoro algebra 14

2 Conformal field theory 17
2.1 Conformal symmetry in two dimensions 17
2.2 Primary fields 18
2.3 Conformal properties of the energy-momentum tensor 20
2.4 Virasoro algebra for CFT 21
2.5 Descendant operators 22
2.6 Hilbert space of states 23
2.7 Unitary CFT and Kac determinant 25
2.8 Characters 28
2.9 Correlators and the conformal Ward identity 29
2.10 Crossing symmetry, duality and bootstrap 31
2.11 Verlinde’s formula 33
2.12 Free Majorana fermions – an example of a CFT 34
2.13 The Ising model – the $m = 3$ unitary minimal model 37
## Contents

3 **Theories invariant under affine current algebras** 39  
3.1 Simple finite-dimensional Lie algebras 39  
3.2 Affine current algebra 44  
3.3 Current OPEs and the Sugawara construction 49  
3.4 Primary fields 51  
3.5 ALA characters 52  
3.6 Correlators, null vectors and the Knizhnik–Zamolodchikov equation 53  
3.7 Free fermion realization 55  
3.8 Free Dirac fermions and the $\hat{U}(N)$ 58  

4 **Wess–Zumino–Witten model and coset models** 61  
4.1 From free massless scalar theory to the WZW model 61  
4.2 Perturbative conformal invariance 65  
4.3 ALA, Sugawara construction and the Virasoro algebra 66  
4.4 Correlation functions of primary fields 67  
4.5 WZW models with boundaries – D branes 71  
4.6 G/H coset models 73  
4.7 G/G coset models 75  

5 **Solitons and two-dimensional integrable models** 79  
5.1 Introduction 79  
5.2 From the theory of a massive free scalar field to integrable models 79  
5.3 Classical solitons 81  
5.4 Breathers or “doublets” 86  
5.5 Quantum solitons 88  
5.6 Integrability and factorized S-matrix 92  
5.7 Yang–Baxter equations 94  
5.8 The general solution of the S-matrix 95  
5.9 From conformal field theories to integrable models 99  
5.10 Conserved charges and classical integrability 101  
5.11 Multilocal conserved charges 104  
5.12 Quantum integrable charges in the $O(N)$ model 107  
5.13 Non-local charges and quantum groups 108  
5.14 Integrable spin chain models and the algebraic Bethe ansatz 111  
5.15 The continuum thermodynamic Bethe ansatz 125  

6 **Bosonization** 131  
6.1 Abelian bosonization 132  
6.2 Duality between the Thirring model and the sine-Gordon model 136  
6.3 Witten’s non-abelian bosonization 139  
6.4 Chiral bosons 148

Preface

Field theory is the framework with which one describes the theory of the standard model of elementary particles and their interactions. The electromagnetic sector (QED) of the standard model is understood extremely well using perturbation theory, but the color interaction (QCD) which is responsible for hadron physics can only be accounted for perturbatively for a limited set of observational data. Due to the fact that at long distances the color interaction is strongly coupled, one cannot reliably apply perturbative methods to extract, for instance, the spectrum of the hadrons. The arsenal of tools to handle strongly coupled systems is obviously much more limited than the one used for weakly coupled ones. Nevertheless, several methods to handle non-perturbative field theories have been developed. The main goal of this book is to expose the reader to those techniques and to describe their applications in two-dimensional and four-dimensional field theories and finally in QCD in four dimensions.

The topic of non-perturbative field theory is by itself very rich and it is clear that one cannot cover it in a non superficial manner in one book. Thus we had to make certain decisions about the flow of the book and about the topics that should be addressed. As for the former issue we have decided to present the book in three parts. In the first part we describe, in detail, the most important non-perturbative techniques of two-dimensional field theory. The reason for this is obvious since physical systems with one space dimension and one time dimension are the simplest and hence it is easier to grasp the non-perturbative tools when applied to these systems. In the second part of the book we study two-dimensional gauge theories with the emphasis on employing the techniques developed in the first part. The third part is devoted to the non-perturbative aspects of gauge dynamics in four dimensions. In this part we elevate the techniques of the first part to four dimensions and we examine to what extent gauge theories in four dimensions behave like their two-dimensional simplified analogs.

There are several books on the shelves discussing non-perturbative methods in general such as [66] and [182], there are books describing one particular method, like conformal field theory in two dimensions for instance [77], there are books that describe two-dimensional QCD, [2] and books that study various aspects of four-dimensional QCD, for example [151] and of course there are books on the basics of field theory, for example [37], [130], [173] and [215]. The aim of this book is three-fold, to review a package of non-perturbative methods, to present a picture which is close to the state-of-the-art in the topics described and to
demonstrate application of the methods in addressing several questions of gauge dynamics.

The particular methods we explore in Part 1 of the book associate with conformal field theory, with affine Lie algebras, with topological properties of fields, solitons and integrable models, with bosonization and with the large $N$ approximation.

In Part 2 we first present the basics of gauge field theories in two dimensions and in particular the bosonized version of them, we then describe the seminal large $N$ solution of 't Hooft of the mesonic spectrum of two-dimensional QCD; we address the mesonic spectrum using current algebra methods, we describe the discrete light-cone quantization of QCD with quarks in the fundamental representation and also adjoint quarks, we compute the spectrum of baryons and their properties in the strong coupling limit, we discuss the issue of confinement versus screening behavior, we analyze $QCD_2$ using coset model and BRST techniques, and finally we digress and devote a chapter to generalized Yang–Mills theory on Riemann surfaces and their stringy nature.

In Part 3 we demonstrate the applications in four-dimensional gauge dynamics of conformal invariance, techniques of integrable models, of large $N$ expansion and of topology. In particular we devote chapters to Skyrmions, magnetic monopoles and gauge theory instantons.

As we have mentioned above we had to take decisions about what topics related to non-perturbative field theory we should not include. We decided not to address string theories, supersymmetric field theories and the holographic string (gravity)/gauge duality. The main reason for this decision was that to cover each of these topics requires a book in itself, or even more than one book. In fact certain subjects that we do cover in the book, like conformal field theory, magnetic monopoles or instantons would require a full book to cover properly. What we have tried to achieve is to describe the basic ideas of each topic and to demonstrate its application. We have also not treated subjects like anomalies, lattice formulations, sigma models, chiral Lagrangians and other non-perturbative topics.

Some topics described in the book are “fully established topics”, in the sense that presumably the most important developments in those have been already achieved, for instance conformal field theory in two dimensions and bosonization in two dimensions. On the other hand some other topics of the book are under current intensive investigation and are certainly still not fully established. An example of the latter is integrability in four-dimensional gauge dynamics. The reason we have decided to include topics of the latter kind is that we wanted the book to be fairly up to date and useful to researchers investigating “modern” topics.

In the more basic issues we have made an effort to present the material in a pedagogical manner and to be self contained. For instance our discussion started from a free massless scalar field theory in two dimensions and gradually evolved
into general conformal field theories. In dealing with more advanced topics, like for instance instantons in four dimensions, the reader will need to consult with specialized references to obtain a more complete and wider picture of the topic.

Some of the content of the book, mainly in Part 2, is based on the research work of the authors, but most of the material is a review of the work of many researchers in the field.

The book is aimed for advanced Ph.D. students, post-docs and other newcomers to the arena of non-perturbative methods in field theory. The reader should definitely be equipped with a basic knowledge of field theory, group theory and algebra, differential equations, geometry and topology.

Throughout the book we refer to only a limited list of references. The number of scientific contributions to the topics discussed in this book is enormous and since we could not cover all of them we have referred to papers that initiated the various topics, and to review papers and books where a much more exhaustive list of references can be found.

We have made an attempt to keep the same notations throughout the book. However in certain instances we have changed notations during the course of the book, mainly to be in accordance with relevant literature. In these cases we specified explicitly the change in notation made.
Acknowledgements

We would like to thank Ori Sonnenschein for drawing the figures of the book.

We would like to thank O. Aharony, M. Karliner and S. Theisen for their remarks on the manuscript.

The work of Jacob Sonnenschein was supported in part by the Albert Einstein Minerva Center of The Weizmann Institute of Science.
