<i>Prefaces</i>	<i>page</i>	xi
1 Introduction		1
1.1 The challenge		1
1.2 Discovery status		1
1.3 Outline of the treatment		3
1.3.1 Observational techniques		3
1.3.2 Host star properties and brown dwarfs		5
1.3.3 Theoretical considerations		5
1.4 Astronomical terms and units		5
1.5 Definition of a planet		7
1.6 On-line reference compilations		7
2 Radial velocities		9
2.1 Description of orbits		9
2.1.1 Orbits from radial velocity measurements		12
2.2 Measurement principles and accuracies		16
2.2.1 Introduction		16
2.2.2 Cross-correlation spectroscopy		17
2.2.3 Deriving radial velocities from Doppler shifts		17
2.2.4 Wavelength calibration		18
2.2.5 Exposure metering		21
2.2.6 Accuracy limits		21
2.2.7 Excluding other sources of periodicity		22
2.3 Instrument programmes		23
2.3.1 State-of-the-art in échelle spectroscopy		23
2.3.2 Externally dispersed interferometry		25
2.3.3 Future developments		27
2.4 Results to date		28
2.4.1 The first radial velocity exoplanets		28
2.4.2 The present radial velocity census		28
2.4.3 On-line compilations		28
2.4.4 Main sequence stars		29
2.4.5 Evolved stars		32
2.4.6 Other star categories		34
2.5 Properties of the radial velocity planets		34
2.5.1 Frequency of massive planets		35
2.5.2 Mass distribution		35
2.5.3 Orbits		36
2.5.4 Host star dependencies		37

2.6	Multiple planet systems	37
2.6.1	General considerations	38
2.6.2	Resonances	40
2.6.3	Long-term integration and system stability	43
2.6.4	Systems with three or more giant planets	47
2.6.5	Systems in mean motion resonance	49
2.6.6	Interacting doubles	55
2.6.7	Non-interacting doubles	55
2.6.8	Super-Earth systems	55
2.6.9	Stability of habitable zone systems	55
2.7	Planets around binary and multiple stars	55
2.7.1	Configurations and stability	56
2.7.2	Present inventory	59
2.7.3	Specific examples	60
3	Astrometry	61
3.1	Introduction	61
3.2	Astrometric accuracy from ground	62
3.3	Microarcsec astrometry	64
3.4	Astrophysical limits	65
3.4.1	Surface structure jitter	65
3.5	Multiple planets and mandalas	66
3.6	Modeling planetary systems	67
3.7	Astrometric measurements from ground	68
3.8	Astrometric measurements from space	69
3.8.1	Hipparcos	69
3.8.2	HST–Fine Guidance Sensor	70
3.9	Future observations from space	71
4	Timing	75
4.1	Pulsars	75
4.1.1	PSR B1257+12	75
4.1.2	PSR B1620–26	77
4.1.3	Other considerations	78
4.2	Pulsating stars	79
4.2.1	White dwarfs	79
4.2.2	Hot subdwarfs	81
4.3	Eclipsing binaries	81
4.3.1	Confirmed planets	81
4.3.2	Unconfirmed planets	82
5	Microlensing	83
5.1	Introduction	83
5.2	Description	84
5.3	Caustics and critical curves	87
5.4	Other light curve effects	90
5.5	Microlens parallax and lens mass	92
5.6	Astrometric microlensing	94
5.7	Other configurations	95
5.8	Microlensing observations in practice	96
5.9	Exoplanet results	98
5.9.1	Individual objects	98
5.9.2	Statistical results	100
5.10	Summary of limitations and strengths	100
5.11	Future developments	102

6	Transits	103
6.1	Introduction	103
6.2	Transit searches	104
6.2.1	Large-field searches from the ground	105
6.2.2	Other searches from the ground	108
6.2.3	Searches in open and globular clusters	109
6.2.4	Future searches from the ground	110
6.2.5	Searches from space	110
6.2.6	Follow-up observations from space	112
6.2.7	Future observations from space	114
6.2.8	Searches around specific stellar types	114
6.3	Noise limits	115
6.4	Transit light curves	117
6.4.1	Observables	117
6.4.2	Theoretical light curves	117
6.4.3	Circular orbits	119
6.4.4	Eccentric orbits	121
6.4.5	Physical quantities	123
6.4.6	Interferometric observations	123
6.4.7	Reflected light	124
6.4.8	Doppler variability	126
6.4.9	Polarisation	126
6.4.10	Secondary eclipse	126
6.4.11	Rossiter–McLaughlin effect	127
6.4.12	Higher-order photometric effects	130
6.4.13	Higher-order timing effects	132
6.4.14	Higher-order spectroscopic effects	136
6.5	Transmission and emission spectroscopy	137
6.5.1	Background	137
6.5.2	Observations	139
6.6	Properties of transiting planets	143
6.6.1	Mass–radius relation	143
6.6.2	Observed correlations	146
7	Imaging	149
7.1	Introduction	149
7.2	Techniques	150
7.2.1	Active optics	150
7.2.2	Adaptive optics	150
7.2.3	Coronagraphic masks	152
7.2.4	Speckle noise	157
7.3	Ground-based imaging instruments	158
7.3.1	Extreme adaptive optics instruments	158
7.3.2	Extremely large telescopes	159
7.3.3	Imaging from the Antarctic	161
7.3.4	Ground-based interferometry	162
7.4	Space-based imaging	162
7.4.1	Existing telescopes	162
7.4.2	Space interferometry	163
7.4.3	The future: resolved imaging	167
7.5	Imaging results	169
7.5.1	Searches around nearby stars	170
7.5.2	Searches around exoplanet host stars	170
7.5.3	Searches in systems with debris disks	171
7.5.4	Searches around white dwarfs	172

7.6	Observations at radio wavelengths	173
7.6.1	Astrometry	173
7.6.2	Direct imaging	173
7.7	Observations at mm/sub-mm wavelength	177
7.8	Miscellaneous signatures	177
7.8.1	Planetary and proto-planet collisions	177
7.8.2	Collisional debris	178
7.8.3	Accretion onto the central star	178
7.8.4	Gravitational wave modulation	179
8	Host stars	181
8.1	Knowledge from astrometry	181
8.1.1	Hipparcos distances and proper motions	181
8.1.2	Nearby star census	181
8.1.3	Galactic coordinates	183
8.2	Photometry and spectroscopy	184
8.3	Evolutionary models	186
8.4	Element abundances	188
8.4.1	Metallicity	188
8.4.2	Possible biases	191
8.4.3	Origin of the metallicity difference	191
8.4.4	Refractory and volatile elements	194
8.4.5	The r- and s-process elements	198
8.4.6	The alpha elements	198
8.4.7	Lithium	199
8.4.8	Beryllium	201
8.5	Asteroseismology	201
8.5.1	Principles	201
8.5.2	Application to exoplanet host stars	203
8.6	Activity and X-ray emission	205
8.6.1	Magnetic and chromospheric activity	205
8.6.2	X-ray emission	206
8.7	Stellar multiplicity	206
9	Brown dwarfs and free-floating planets	209
9.1	Brown dwarfs	209
9.1.1	The role of fusion	209
9.1.2	Detection	209
9.1.3	Luminosity and age	211
9.1.4	Classification	212
9.1.5	Recognising brown dwarfs	212
9.1.6	Other properties	213
9.1.7	Formation	214
9.2	Free-floating objects of planetary mass	215
10	Formation and evolution	217
10.1	Overview	217
10.2	Star formation	217
10.3	Disk formation	218
10.3.1	Initial collapse	218
10.3.2	Young stellar objects	219
10.3.3	Protoplanetary disks	220
10.3.4	Debris disks	222
10.4	Terrestrial planet formation	224
10.4.1	The context	224

10.4.2	Stages in the formation of terrestrial planets	225
10.5	Size, shape, and internal structure	230
10.6	Giant planet formation	231
10.6.1	Formation by core accretion	231
10.6.2	Formation by gravitational disk instability	235
10.7	Formation of planetary satellites	237
10.8	Orbital migration	237
10.8.1	Evidence for migration	237
10.8.2	Gas disk migration	238
10.8.3	Planetesimal disk migration	243
10.8.4	Planet–planet scattering	243
10.9	Tidal effects	244
10.9.1	Tidal evolution of close-in planets	244
10.9.2	Orbital evolution	245
10.9.3	Spin-up of host stars	248
10.9.4	Tidal heating	249
10.9.5	Tidal heating and habitability	250
10.10	Population synthesis	251
11	Interiors and atmospheres	255
11.1	Introduction	255
11.2	Planetary constituents	255
11.2.1	Gas, rock, and ice	255
11.2.2	Chemical composition and condensation	257
11.3	Models of giant planet interiors	260
11.3.1	Equations of state	261
11.3.2	Hydrogen and water	261
11.3.3	Structural models	263
11.4	Predictions of interior models	265
11.4.1	Dependence on composition	265
11.4.2	H/He dominated gas giants	266
11.5	Super-Earths	267
11.5.1	General models	267
11.5.2	Ocean planets	269
11.6	Diagnostics from rotation	270
11.7	Atmospheres of gas giants	271
11.8	Atmospheres of terrestrial planets	278
11.8.1	Atmospheric formation	278
11.8.2	Atmospheric erosion	279
11.8.3	Atmospheres of ejected planets	281
11.9	Habitability	282
11.9.1	The habitable zone	283
11.9.2	Exoplanets in the habitable zone	286
11.9.3	Spectroscopic indicators of life	287
11.9.4	SETI	290
12	The solar system	293
12.1	Birth in clusters	293
12.2	The solar system giants	293
12.3	Minor bodies in the solar system	295
12.4	Solar nebula abundances	295
12.5	Constraints on formation	296
12.6	Orbit considerations	299
12.7	Planetesimal migration in the solar system	302
12.8	Atmosphere of the Earth	305
