Preface	<i>page</i> xv
Acknowledgments	xviii
Definitions	xix
1 Introduction	1
1.1 Relevant questions for thermodynamics	2
1.2 Work and energy	4
Exercises	5
2 The postulates of thermodynamics	7
2.1 The postulational approach	7
2.2 The first law: energy conservation	8
2.3 Definition of heat	10
2.4 Equilibrium states	15
2.5 Entropy, the second law, and the fundamental relation	15
2.6 Definitions of temperature, pressure, and chemical potential	22
2.7 Temperature differences and heat flow	33
2.8 Pressure differences and volume changes	35
2.9 Thermodynamics in one dimension	37
Summary	40
Exercises	41
3 Generalized thermodynamic potentials	52
3.1 Legendre transforms	53
3.2 Extremum principles for the potentials	58
3.3 The Maxwell relations	66
3.4 The thermodynamic square	68
3.5 Second-order coefficients	70
3.6 Thermodynamic manipulations	78
3.7 One- and two-dimensional systems	83
3.7.1 A non-ideal rubber band	83
3.7.2 Unzipping DNA	85
3.7.3 Langmuir adsorption	90
Summary	96
Exercises	97

4	First applications of thermodynamics	112
4.1	Stability criteria	112
4.1.1	Entropy	113
4.1.2	Internal energy	116
4.1.3	Generalized potentials	116
4.2	Single-component vapor–liquid equilibrium	118
4.2.1	The spinodal curve of a van der Waals fluid	118
4.2.2	The binodal (or coexistence) curve of a van der Waals fluid	122
4.2.3	The general formulation	126
4.2.4	Approximations based on the Clapeyron equation	127
4.3	Crystallization of solids	128
4.4	Thermodynamic diagrams	129
4.4.1	Construction of fundamental relations from two equations of state for single-component systems	131
4.4.2	Residual properties	135
	Summary	141
	Exercises	141
5	Application to process design: flow systems	149
5.1	Macroscopic mass, energy, and entropy balances	150
5.1.1	The throttling process	154
5.1.2	Specifications for a turbine generator	156
5.1.3	Work requirements for a pump	158
5.1.4	The Ranque–Hilsch vortex tube	159
5.1.5	Fuel cells	162
5.2	Cycles	166
5.2.1	The Carnot cycle	167
5.2.2	The Rankine power cycle	169
5.2.3	The refrigeration cycle	173
	Summary	177
	Exercises	178
6	Statistical mechanics	181
6.1	Ensemble and time averages	181
6.2	The canonical ensemble	184
6.3	Ideal gases	187
6.3.1	A simple ideal gas	187
6.3.2	A general ideal gas	190
6.4	Langmuir adsorption	192
6.5	The grand canonical ensemble	194
6.6	An elastic strand	196
6.7	Fluctuations	199

	Contents	xi
Summary		204
Exercises		205
7 Molecular interactions		211
7.1 Ideal gases		211
7.2 Intermolecular interactions		212
7.2.1 The significance of " $k_B T$ "		212
7.2.2 Interactions at long distances		213
7.2.3 Interactions at short distances		219
7.2.4 Empirical potential-energy functions		220
7.2.5 Hydrogen bonds		224
7.3 Molecular simulations		225
7.4 The virial expansion		227
7.5 Equations of state for liquids		230
7.6 Experimental manifestations of intermolecular interactions		231
Conclusions		235
Exercises		236
8 Fugacity and vapor–liquid equilibrium		246
8.1 General equations of phase equilibria		247
8.2 Mixtures of ideal gases		247
8.3 Mixtures: partial molar properties		249
8.3.1 Definition of a partial molar property		249
8.3.2 General properties of partial molar quantities		251
8.3.3 Residual partial molar quantities		255
8.4 Fugacity		257
8.4.1 Definition of fugacity		257
8.4.2 Properties of fugacity		258
8.4.3 Estimating the fugacity of a pure vapor or liquid		259
8.5 Calculation of fugacity coefficients of mixtures from <i>PVT</i> equations of state		263
8.6 Fugacity in ideal or Lewis mixtures		267
8.6.1 Lewis mixing		267
8.6.2 Properties of Lewis (ideal) mixtures		268
8.6.3 A simple application of Lewis (ideal) mixing: Raoult's law		270
8.7 Solubility of solids and liquids in compressed gases		271
8.7.1 Phase equilibria between a solid and a compressed gas		271
8.7.2 Phase equilibria between a liquid and a compressed gas		272
Summary		273
Exercises		275
9 Activity and equilibrium		282
9.1 Excess properties and activities		282
9.2 A summary of fugacity and activity		285

9.3	Correlations for partial molar excess Gibbs free energy	286
9.3.1	Simple binary systems	286
9.3.2	Thermodynamic consistency	291
9.4	Semi-theoretical expressions for activity coefficients	292
9.4.1	The van Laar equation	293
9.4.2	Wilson's equation	293
9.4.3	The NRTL equation	294
9.4.4	The UNIQUAC model	295
9.5	Dilute mixtures: Henry's constants	296
9.5.1	Measurement of activity coefficients	299
9.6	The blood–brain barrier	303
9.7	Partial miscibility	305
9.7.1	Thermodynamic stability	305
9.7.2	Liquid–liquid equilibria in ternary mixtures	310
9.7.3	Critical points	311
9.8	Simple free-energy models from statistical mechanics	313
9.8.1	Lewis mixing	314
9.8.2	The Margules model	315
9.8.3	Exact solution of the lattice model	316
	Summary	316
	Exercises	317
10	Reaction equilibrium	328
10.1	A simple picture: the reaction coordinate	328
10.2	Extent of reaction	330
10.3	The equilibrium criterion	332
10.4	The reaction equilibrium constant	333
10.5	Standard property changes	334
10.6	Estimating the equilibrium constant	335
10.7	Determination of equilibrium compositions	340
10.8	Enzymatic catalysis: the Michaelis–Menten model	342
10.9	Denaturation of DNA and polymerase chain reactions	343
10.9.1	Denaturation	344
10.9.2	Polymerase chain reaction	346
10.10	Statistical mechanics of reactions and denaturation	347
10.10.1	Stochastic fluctuations in reactions	347
10.10.2	DNA denaturation	353
	Summary	355
	Exercises	356
11	Thermodynamics of polymers	365
11.1	Solubility and miscibility of polymer solutions	365
11.2	Generalizations of the Flory–Huggins theory	370

	Contents	xiii
11.2.1 The generalization of Qian <i>et al.</i>		370
11.2.2 The Sanchez–Lacombe equation of state		374
11.2.3 The BGY model		380
11.3 Block copolymers		383
11.4 Derivation of the Flory–Huggins theory		386
Summary		390
Exercises		390
12 Thermodynamics of surfaces		393
12.1 The interfacial tension of a planar interface		393
12.2 The Gibbs free energy of a surface phase and the Gibbs–Duhem relation		395
12.3 Curved interfaces		396
12.4 Solid–liquid interfaces: wetting		401
12.5 Capillary forces		403
12.6 Solid–gas interfaces: adsorption		409
12.7 The temperature dependence of surface tension		410
12.8 Interfaces in mixtures		411
12.8.1 Vapor–liquid interfaces		412
12.8.2 Monolayer formation on liquid surfaces		416
Summary		419
Exercises		420
Appendix A Mathematical background		426
A.1 Taylor’s series expansion		426
A.2 The chain rule		427
A.3 Jacobian transformations		429
A.4 The fundamental theorem of calculus		431
A.5 Leibniz’s rule		431
A.6 The Gauss divergence theorem		432
A.7 Solutions to cubic equations		432
A.8 Combinatorics		434
A.8.1 The binomial theorem		434
A.8.2 The multinomial theorem		435
Appendix B Fluid equations of state		437
B.1 A general ideal gas		437
B.2 The virial equation of state		438
B.3 The van der Waals fluid		440
B.4 The Carnahan–Starling equation of state		441
B.5 The Redlich–Kwong equation of state		442
B.6 The Peng–Robinson equation of state		444
B.7 Martin’s generalized cubic equation of state		445

Contents

B.8	The Benedict–Webb–Rubin equation of state	446
B.9	The Anderko–Pitzer equation of state	447
Appendix C Microscopic balances for open systems		451
C.1	Mass: the continuity equation	451
C.2	Momentum: the equation of motion	453
C.3	Energy: the microscopic energy balance	454
C.4	Entropy: the microscopic entropy balance	455
C.5	Entropy flux and generation in laminar flow	458
Appendix D Physical properties and references		461
D.1	Websites with data and programs	461
D.2	Entropy and properties of formation	462
D.3	Physical constants	468
D.4	Steam tables	469
	References	470
	Index	477
