Preface	<i>page</i> xv
Prelude	xix
1 The Earth-atmosphere system	1
1.1 Introduction	1
1.1.1 Descriptions of atmospheric behavior	1
1.1.2 Mechanisms influencing atmospheric behavior	2
1.2 Composition and structure	3
1.2.1 Description of air	3
1.2.2 Stratification of mass	7
1.2.3 Thermal and dynamical structure	14
1.2.4 Trace constituents	20
1.2.5 Cloud	41
1.3 Radiative equilibrium of the Earth	46
1.4 The global energy budget	48
1.4.1 Global-mean energy balance	48
1.4.2 Horizontal distribution of radiative transfer	50
1.5 The general circulation	53
1.6 Historical perspective: Global-mean temperature	56
1.6.1 The instrumental record	57
1.6.2 Proxy records	65
Suggested references	71
Problems	71
2 Thermodynamics of gases	74
2.1 Thermodynamic concepts	74
2.1.1 Thermodynamic properties	75
2.1.2 Expansion work	75
2.1.3 Heat transfer	77
2.1.4 State variables and thermodynamic processes	77

viii	Contents
2.2 The First Law	81
2.2.1 Internal energy	81
2.2.2 Diabatic changes of state	82
2.3 Heat capacity	83
2.4 Adiabatic processes	86
2.4.1 Potential temperature	87
2.4.2 Thermodynamic behavior accompanying vertical motion	90
2.5 Diabatic processes	91
2.5.1 Polytopic processes	92
Suggested references	93
Problems	93
3 The Second Law and its implications	95
3.1 Natural and reversible processes	95
3.1.1 The Carnot cycle	98
3.2 Entropy and the Second Law	99
3.3 Restricted forms of the Second Law	102
3.4 The fundamental relations	103
3.4.1 The Maxwell Relations	104
3.4.2 Noncompensated heat transfer	104
3.5 Conditions for thermodynamic equilibrium	105
3.6 Relationship of entropy to potential temperature	107
3.6.1 Implications for vertical motion	107
Suggested references	110
Problems	110
4 Heterogeneous systems	112
4.1 Description of a heterogeneous system	112
4.2 Chemical equilibrium	115
4.3 Fundamental relations for a multi-component system	117
4.4 Thermodynamic degrees of freedom	118
4.5 Thermodynamic characteristics of water	119
4.6 Equilibrium phase transformations	122
4.6.1 Latent heat	122
4.6.2 Clausius-Clapeyron Equation	123
Suggested references	125
Problems	126
5 Transformations of moist air	127
5.1 Description of moist air	127
5.1.1 Properties of the gas phase	127
5.1.2 Saturation properties	129
5.2 Implications for the distribution of water vapor	131
5.3 State variables of the two-component system	132
5.3.1 Unsaturated behavior	133
5.3.2 Saturated behavior	133
5.4 Thermodynamic behavior accompanying vertical motion	135
5.4.1 Condensation and the release of latent heat	135

Contents	ix
5.4.2 The pseudo-adiabatic process	139
5.4.3 The Saturated Adiabatic Lapse Rate	141
5.5 The pseudo-adiabatic chart	142
Suggested references	146
Problems	146
6 Hydrostatic equilibrium	150
6.1 Effective gravity	150
6.2 Geopotential coordinates	152
6.3 Hydrostatic balance	153
6.3.1 Hypsometric equation	154
6.3.2 Meteorological Analyses	154
6.4 Stratification	157
6.4.1 Idealized stratification	159
6.5 Lagrangian interpretation of stratification	161
6.5.1 Adiabatic stratification: A paradigm of the troposphere	162
6.5.2 Diabatic stratification: A paradigm of the stratosphere	165
Suggested references	168
Problems	168
7 Static stability	171
7.1 Reaction to vertical displacement	171
7.2 Stability categories	173
7.2.1 Stability in terms of temperature	174
7.2.2 Stability in terms of potential temperature	175
7.2.3 Moisture dependence	178
7.3 Implications for vertical motion	179
7.4 Finite displacements	180
7.4.1 Conditional instability	181
7.4.2 Entrainment	186
7.4.3 Potential instability	188
7.4.4 Modification of stability under unsaturated conditions	190
7.5 Stabilizing and destabilizing influences	191
7.6 Turbulent dispersion	194
7.6.1 Convective mixing	194
7.6.2 Inversions	194
7.6.3 Life cycle of the nocturnal inversion	195
7.7 Relationship to observed thermal structure	197
Suggested references	200
Problems	200
8 Radiative transfer	203
8.1 Shortwave and longwave radiation	203
8.1.1 Spectra of observed SW and LW radiation	204
8.2 Description of radiative transfer	209
8.2.1 Radiometric quantities	209

x	Contents
8.2.2	Absorption 211
8.2.3	Emission 212
8.2.4	Scattering 216
8.2.5	The Equation of Radiative Transfer 218
8.3	Absorption characteristics of gases 219
8.3.1	Interaction between radiation and molecules 219
8.3.2	Line broadening 224
8.4	Radiative transfer in a plane parallel atmosphere 227
8.4.1	Transmission function 229
8.4.2	Two-stream approximation 231
8.5	Thermal equilibrium 234
8.5.1	Radiative equilibrium in a gray atmosphere 234
8.5.2	Radiative-convective equilibrium 237
8.5.3	Radiative heating 240
8.6	Thermal relaxation 245
8.7	The greenhouse effect 247
8.7.1	Feedback in the climate system 249
8.7.2	Unchecked feedback 258
8.7.3	Simulation of climate 260
	Suggested references 262
	Problems 262
9	Aerosol and cloud 266
9.1	Morphology of atmospheric aerosol 266
9.1.1	Continental aerosol 266
9.1.2	Marine aerosol 271
9.1.3	Stratospheric aerosol 271
9.2	Microphysics of cloud 272
9.2.1	Droplet growth by condensation 272
9.2.2	Droplet growth by collision 281
9.2.3	Growth of ice particles 282
9.3	Macroscopic characteristics of cloud 284
9.3.1	Formation and classification of cloud 284
9.3.2	Microphysical properties of cloud 292
9.3.3	Cloud dissipation 293
9.3.4	Cumulus detrainment: Influence on the environment 294
9.4	Radiative transfer in aerosol and cloud 298
9.4.1	Scattering by molecules and particles 298
9.4.2	Radiative transfer in a cloudy atmosphere 305
9.5	Roles of cloud and aerosol in climate 315
9.5.1	Involvement in the global energy budget 315
9.5.2	Involvement in chemical processes 324
	Suggested references 324
	Problems 325
10	Atmospheric motion 328
10.1	Description of atmospheric motion 329
10.2	Kinematics of fluid motion 330

Contents	xi
10.3 The material derivative	334
10.4 Reynolds' transport theorem	334
10.5 Conservation of mass	336
10.6 The momentum budget	337
10.6.1 Cauchy's Equations of Motion	337
10.6.2 Momentum equations in a rotating reference frame	339
10.7 The first law of thermodynamics	341
Suggested references	343
Problems	343
11 Atmospheric equations of motion	345
11.1 Curvilinear coordinates	345
11.2 Spherical coordinates	348
11.2.1 The traditional approximation	353
11.3 Special forms of motion	354
11.4 Prevailing balances	355
11.4.1 Motion-related stratification	355
11.4.2 Scale analysis	356
11.5 Thermodynamic coordinates	358
11.5.1 Isobaric coordinates	358
11.5.2 Log-pressure coordinates	363
11.5.3 Isentropic coordinates	365
Suggested references	369
Problems	369
12 Large-scale motion	371
12.1 Geostrophic equilibrium	371
12.1.1 Motion on an f plane	374
12.2 Vertical shear of the geostrophic wind	376
12.2.1 Classes of stratification	377
12.2.2 Thermal wind balance	379
12.3 Frictional geostrophic motion	380
12.4 Curvilinear motion	382
12.4.1 Inertial motion	384
12.4.2 Cyclostrophic motion	385
12.4.3 Gradient motion	385
12.5 Weakly divergent motion	386
12.5.1 Barotropic nondivergent motion	386
12.5.2 Vorticity budget under baroclinic stratification	387
12.5.3 Quasi-geostrophic motion	392
Suggested references	395
Problems	395
13 The planetary boundary layer	398
13.1 Description of turbulence	399
13.1.1 Reynolds decomposition	401
13.1.2 Turbulent diffusion	403

xii	Contents
13.2 Structure of the boundary layer	404
13.2.1 The Ekman Layer	404
13.2.2 The surface layer	406
13.3 Influence of stratification	406
13.4 Ekman pumping	410
Suggested references	413
Problems	413
14 Wave propagation	416
14.1 Description of wave propagation	416
14.1.1 Surface water waves	416
14.1.2 Fourier synthesis	419
14.1.3 Limiting behavior	422
14.1.4 Wave dispersion	424
14.2 Acoustic waves	428
14.3 Buoyancy waves	429
14.3.1 Shortwave limit	435
14.3.2 Propagation of gravity waves in an inhomogeneous medium	436
14.3.3 The WKB approximation	438
14.3.4 Method of geometric optics	439
14.4 The Lamb wave	444
14.5 Rossby waves	446
14.5.1 Barotropic nondivergent Rossby waves	446
14.5.2 Rossby wave propagation in three dimensions	448
14.5.3 Planetary wave propagation in sheared mean flow	451
14.5.4 Transmission of planetary wave activity	454
14.6 Wave absorption	457
14.7 Nonlinear considerations	459
Suggested references	466
Problems	467
15 The general circulation	470
15.1 Forms of atmospheric energy	471
15.1.1 Moist static energy	472
15.1.2 Total potential energy	473
15.1.3 Available potential energy	475
15.2 Heat transfer in a zonally symmetric circulation	478
15.3 Heat transfer in a laboratory analogue	486
15.4 Quasi-permanent features	489
15.4.1 Thermal properties of the Earth's surface	489
15.4.2 Surface pressure and wind systems	491
15.4.3 Tropical circulations	494
15.5 Fluctuations of the circulation	499
15.5.1 Interannual changes	500
15.5.2 Intraseasonal variations	509
Suggested references	512
Problems	512

Contents	xiii
16 Dynamic stability	515
16.1 Inertial instability	515
16.2 Shear instability	517
16.2.1 Necessary conditions for instability	517
16.2.2 Barotropic and baroclinic instability	519
16.3 The Eady model	520
16.4 Nonlinear considerations	526
Suggested references	531
Problems	531
17 Influence of the ocean	533
17.1 Composition and structure	533
17.1.1 Stratification	536
17.1.2 Motion	538
17.2 Role in the heat budget	541
17.3 Role in the carbon cycle	544
17.4 The wind-driven circulation	546
17.4.1 The Ekman layer	546
17.4.2 Sverdrup balance	551
17.5 The buoyancy-driven circulation	553
17.6 Interannual changes	556
Suggested references	564
Problems	564
18 Interaction with the stratosphere	566
18.1 Ozone photochemistry	567
18.1.1 The chemical family	567
18.1.2 Photochemical equilibrium	568
18.2 Involvement of other species	570
18.2.1 Nitrous oxide	571
18.2.2 Chlorofluorocarbons	572
18.2.3 Methane	574
18.3 Motion	575
18.3.1 The Brewer-Dobson circulation	576
18.3.2 Wave driving of mean meridional motion	577
18.3.3 Transformed Eulerian description	581
18.4 Sudden stratospheric warmings	585
18.5 The quasi-biennial oscillation	589
18.6 Direct interaction with the troposphere	591
18.7 Heterogeneous chemical reactions	596
18.8 Interannual changes	602
Suggested references	615
Problems	615
Appendix A: Conversion to SI units	617
Appendix B: Thermodynamic properties of air and water	618
Appendix C: Physical constants	619

xiv	Contents
Appendix D: Vector identities	620
Appendix E: Curvilinear coordinates	621
Appendix F: Pseudo-adiabatic chart	623
Appendix G: Acronyms	625
Answers to selected problems	627
References	633
Index	647
