<i>Preface</i>	<i>page</i> vii
1 Foundations	1
1.1 Counting prime numbers	2
1.2 Arithmetic functions	6
1.3 Abel summation	9
1.4 Estimation of sums by integrals; Euler's summation formula	18
1.5 The function $\text{li}(x)$	28
1.6 Chebyshev's theta function	33
1.7 Dirichlet series and the zeta function	38
1.8 Convolutions	50
2 Some important Dirichlet series and arithmetic functions	56
2.1 The Euler product	57
2.2 The Möbius function	61
2.3 The series for $\log \zeta(s)$ and $\zeta'(s)/\zeta(s)$	70
2.4 Chebyshev's psi function and powers of primes	75
2.5 Estimates of some summation functions	82
2.6 Mertens's estimates	89
3 The basic theorems	98
3.1 Extension of the definition of the zeta function	99
3.2 Inversion of Dirichlet series; the integral version of the fundamental theorem	114
3.3 An alternative method: Newman's proof	124
3.4 The limit and series versions of the fundamental theorem; the prime number theorem	130
3.5 Some applications of the prime number theorem	138
4 Prime numbers in residue classes: Dirichlet's theorem	147
4.1 Characters of finite abelian groups	148

vi	<i>Contents</i>	
4.2	Dirichlet characters	153
4.3	Dirichlet L -functions	160
4.4	Prime numbers in residue classes	173
5	Error estimates and the Riemann hypothesis	178
5.1	Error estimates	179
5.2	Connections with the Riemann hypothesis	192
5.3	The zero-free region of the zeta function	195
6	An “elementary” proof of the prime number theorem	206
6.1	Framework of the proof	207
6.2	Selberg’s formulae and completion of the proof	212
	<i>Appendices</i>	
A	Complex functions of a real variable	223
B	Double series and multiplication of series	225
C	Infinite products	228
D	Differentiation under the integral sign	230
E	The O, o notation	232
F	Computing values of $\pi(x)$	234
G	Table of primes	238
H	Biographical notes	240
	<i>Bibliography</i>	249
	<i>Index</i>	251
