Global IT Outsourcing

Software Development across Borders

This book offers key insights into how to manage software development across international boundaries. It is based on a series of case studies looking at the relationships between firms from North America, the UK, Japan and Korea and Indian software houses. In these case studies, which have typically been compiled over a 3–4-year timespan, the authors analyse the multi-faceted challenges encountered in managing these Global Software Alliances (GSAs). These challenges range from the conflicts that managers face when dealing with distance to the tensions of transferring knowledge across time and space, to issues in trying to establish universal standards in a context of constant change and the problems of identity that developers and clients experience in having to deal with different organizations and countries. Throughout the book, the authors draw on their extensive research and experience to offer constructive advice on how to manage GSAs more effectively.

Sundeep Sahay is a Professor in Informatics at the University of Oslo, Norway. After completing his doctoral studies at Florida International University, he has held research and teaching positions at the Universities of Cambridge and Salford in the UK, and at the University of Alberta in Canada.

Brian Nicholson is a lecturer in information systems at the University of Manchester, UK. After completing doctoral studies at the University of Salford, UK, his research interests have focused on the complexities of software development and software outsourcing between UK and Indian companies.

S. Krishna is a professor at the Indian Institute of Management, Bangalore. His research interests concern global software work (GSW) arrangements. He holds a PhD in software engineering and chairs IIM's software enterprise management programme, focusing on research and management education in partnership with local software industry.

Foreword

Software is a key element in the increasing use of information and communication technologies in contemporary society, and thus its production and use are of major importance. Outsourcing of software production has been common for many years, but since the late 1980s this has increasingly occurred across national and cultural borders, a phenomenon which is known as ‘global software outsourcing’. Cost is a major driver of this, with production normally located in countries with relatively low wage levels, but outsourcing organizations recognize that effective relationships with their software suppliers must be developed and maintained if full benefits are to be realized. This has resulted in various forms of collaborative arrangements, which can be labelled as ‘Global Software Alliances’ (GSAs).

This book provides rich empirical data on Global Software Work (GSW) and associated organizational alliances. The material is derived from the extensive fieldwork carried out by the authors over a number of years, with special emphasis on outsourcers in Canada, the UK and Japan, and companies in India as the software producers. India is a major success story in this area, with quite exceptional growth rates of its software export sector since the 1990s. However, as the book so vividly illustrates, this has not been achieved without lengthy and sometimes painful learning processes on the part of those involved on both sides of the outsourcing alliances. The longitudinal nature of the fieldwork carried out by the authors enabled them to trace and analyse such processes over several years.

The book can be read at one level, therefore, as a set of ‘war stories’ of the shifting objectives, personnel, relationships and outcomes of the various case studies. However, at another level, the book aims to connect these stories with the broader debate on globalization. The book argues that GSAs can be conceptualized as both a model *of* globalization and a model *for* globalization. In other words, that GSW, in its arrangement and conduct, both reflects globalization phenomena, such as the increasing interconnection of the world across time and space, and is itself one of the contributors to how globalization evolves, since all parties to it are affected by the ongoing process.

The authors also theorize their empirical work through an interesting set of six micro-level themes derived from a combination of their own experiences and aspects of the literature on software outsourcing. One theme, for example, examines tensions between the unbounded global space within which it is feasible in principle to conduct

Foreword

GSW, and the boundedness of the individual software developer's need to belong in a particular place, with all that this entails in terms of family and broader social relationships. Other themes, all of which are related, examine shifting identity, the complexities of knowledge sharing, the limitations and benefits of standardization, issues of power and control and the challenges of cross-cultural communication.

The book will be essential reading for academics and other researchers working in the area of software production and outsourcing, but it will also be of interest to the wider community of scholars concerned with the role of information and communication technologies in the contemporary world, and in particular those trying to understand the phenomena known as 'globalization'. Thoughtful practitioners will also find much of value here. The book does not contain a set of prescriptions on 'how to do it' in all contexts, since the authors would argue that action needs to be context-specific. Nevertheless, they do offer sets of questions which the practitioner will wish to try to answer in their own specific context, based around the areas of the management of knowledge, people, communication and relationships within the overarching concept of managing ethically. The book aims to contribute to both theory and practice in the area of global software work, outsourcing and alliances, and I believe that it will achieve success in this endeavour.

Geoff Walsham

Acknowledgements

Six of the chapters in the book (4, 5, 6, 7, 8 and 9) are based on empirical material that has been written up in earlier papers (or are currently under review). The theoretical lenses applied for the analysis of the empirical material, content and conceptual framework are significantly different from those used in the earlier papers.

Chapter 4 draws upon the empirical material presented in S. Sahay, The challenge of standardization in global software alliances. This paper has been accepted for publication by the *Scandinavian Journal of Information Systems*.

Chapter 5 draws upon the empirical material presented in S. Krishna and S. Sahay, Evolution of global software outsourcing relationship and transformations in identity, Working Paper, Indian Institute of Management, Bangalore and University of Oslo, 2002 (the paper is currently under review in an international IS journal).

Chapter 6 draws upon the empirical material presented in S. Sahay and S. Krishna, An empirical investigation and a dialectical analysis of a global software outsourcing arrangement, Working Paper, University of Oslo, 2002 (the paper is currently under review in an international IS journal).

Chapter 7 draws upon the empirical material presented in B. Nicholson, S. Sahay and S. Krishna, Work practices and local improvisations within global software teams: a case study of a UK subsidiary in India, Proceedings of the IFIP 9.4 Conference on Socio-Economic Impacts of Computers in Developing Countries, Cape Town, 24–26 May.

Chapter 8 draws upon the empirical material presented in B. Nicholson and S. Sahay, The political and cultural implications of the globalization of software development: case experience from UK and India, *Information and Organisation*, 11, 1, 2001, 25–44.

Chapter 9 draws upon the empirical material presented in S. Krishna and S. Sahay, GSO experiences in Korea and Japan: some preliminary investigations, Final Report for the Project, The Context of Innovation of the Information Technology Industry, University of Pennsylvania Institute for the Advanced Study of India, New Delhi, August 2001.
