COMPACT STELLAR X-RAY SOURCES

X-ray astronomy provides the main window onto astrophysical compact objects such as black holes, neutron stars and white dwarfs. In the past ten years new observational opportunities have led to an explosion of knowledge in this field. In sixteen chapters, written by leading experts, this book provides a comprehensive overview of the observations and astrophysics of X-ray emitting stellar-mass compact objects.

Topics discussed in depth include the various phenomena exhibited by compact objects in binary systems such as X-ray bursts, relativistic jets and quasi-periodic oscillations, as well as gamma-ray burst sources, super-soft and ultra-luminous sources, isolated neutron stars, magnetars and the enigmatic fast transients. The populations of X-ray sources in globular clusters and in external galaxies are discussed in detail. This is an invaluable reference for both graduate students and active researchers.

Walter Lewin is Professor of Physics at MIT. A native of The Netherlands, Professor Lewin received his Ph.D. in Physics from the University of Delft (1965). In 1966, he went to MIT as a postdoctoral associate in the Department of Physics and was invited to join the faculty as Assistant Professor later that same year. He was promoted to Associate Professor of Physics in 1968 and to full Professor in 1974. Professor Lewin’s honors and awards include the NASA Award for Exceptional Scientific Achievement (1978), twice recipient of the Alexander von Humboldt Award (1984 and 1991), a Guggenheim Fellowship (1984), MIT’s Science Council Prize for Excellence in Undergraduate Teaching (1984), the W. Buchner Teaching Prize of the MIT Department of Physics (1988) and the Everett Moore Baker Memorial award for excellence in undergraduate teaching (2003). In 1997, he was the recipient of a NASA Group Achievement Award for the Discovery of the Bursting Pulsar. He is a corresponding member of the Royal Netherlands Academy of Arts and Sciences (elected 1993) and Fellow of the American Physical Society.

Michiel van der Klis is Professor of Astronomy at the Astronomical Institute Anton Pannekoek of the University of Amsterdam and winner of the NWO Spinoza Prize (2004) for his pioneering research into X-ray radiation from binary stars. He gained his Ph.D. in 1983 from the University of Amsterdam for his observations of X-ray stars. Following this, he held various positions, including a period at the European Space Research and Technology Centre in Noordwijk. In 1989, he returned to the University of Amsterdam as a senior lecturer and he became a professor there in 1993. In 1987, he received the Bruno Rossi Prize, the highest international award in high-energy astrophysics and in 1990 the Zeldovitch Award for Astrophysics from Space of the International Committee of Space Research (COSPAR). Since 2002 he has been a member of the Royal Academy of Arts and Sciences.
Cambridge Astrophysics Series

Series editors
Andrew King, Douglas Lin, Stephen Maran, Jim Pringle and Martin Ward

Titles available in this series

7. Spectroscopy of Astrophysical Plasmas
   edited by A. Dalgarno and D. Layzer

10. Quasar Astronomy
    by D. W. Weedman

17. Molecular Collisions in the Interstellar Medium
    by D. Flower

18. Plasma Loops in the Solar Corona
    by R. J. Bray, L. E. Cram, C. J. Durrant and R. E. Loughhead

19. Beams and Jets in Astrophysics
    edited by P. A. Hughes

22. Gamma-ray Astronomy 2nd Edition
    by P. V. Ramana Murthy and A. W. Wolfendale

23. The Solar Transition Region
    by J. T. Mariska

24. Solar and Stellar Activity Cycles
    by Peter R. Wilson

25. 3K: The Cosmic Microwave Background Radiation
    by R. B. Partridge

26. X-ray Binaries
    by Walter H. G. Lewin, Jan van Paradijs and Edward P. J. van den Heuvel

27. RR Lyrae Stars
    by Horace A. Smith

28. Cataclysmic Variable Stars
    by Brian Warner

29. The Magellanic Clouds
    by Bengt E. Westerlund

30. Globular Cluster Systems
    by Keith M. Ashman and Stephen E. Zepf

32. Accretion Processes in Star Formation
    by Lee W. Hartmann

33. The Origin and Evolution of Planetary Nebulae
    by Sun Kwok

34. Solar and Stellar Magnetic Activity
    by Carlos J. Schrijver and Cornelis Zwaan

35. The Galaxies of the Local Group
    by Sidney van den Bergh

36. Stellar Rotation
    by Jean-Louis Tassoul

37. Extreme Ultraviolet Astronomy
    by Martin A. Barstow and Jay B. Holberg

38. Pulsar Astronomy 3rd Edition
    by Andrew G. Lyne and F. Graham-Smith

39. Compact Stellar X-ray Sources
    edited by Walter Lewin and Michiel van der Klis

Preface

Extra-solar X-ray astronomy began with the historical paper in Physical Review Letters by Giacconi, Gursky, Paolini, and Rossi (1962). Now, more than four decades later, X-ray astronomy is central to many aspects of astronomy. In 2002, Riccardo Giacconi was awarded the Nobel Prize in Physics “for pioneering contributions to astrophysics, which have led to the discovery of cosmic X-ray sources”. In the decade since the publication of X-ray Binaries – the predecessor of the present book – the study of compact stellar X-ray sources has received enormous impetus from observations with the BeppoSAX, Rossi X-ray Timing Explorer (RXTE), Chandra, and XMM-Newton X-ray observatories. In addition, many exciting new results on these X-ray sources have also been produced in the radio, infrared, optical and ultraviolet bands. Highlights include the discovery in low-mass X-ray binaries of millisecond X-ray pulsations, confirming the connection with the millisecond radio pulsars. Millisecond and sub-millisecond quasi-periodic oscillations (QPO) were discovered that are thought to provide a direct view of regions of strong-field gravity near neutron stars and black holes. The discovery of X-ray, optical and radio afterglows of gamma-ray bursts (GRB) firmly established their long-suspected cosmological distances. Super-luminal motion of radio jets was discovered in accreting black-hole binaries. Dozens of ultra-luminous X-ray sources (ULX) have been detected in many galaxies. Their origin is still not clear; some may be accreting intermediate-mass (i.e., of order \(10^5 \text{ M}_\odot\)) black holes (IMBH). Great progress was also made in our understanding of the soft gamma-ray repeaters (SGR) and anomalous X-ray pulsars (AXP). We now know that they are “magnetars”, neutron stars with magnetic dipole fields of enormous strength \((10^{14} - 10^{15} \text{ G})\). This book is a comprehensive and up-to-date survey on compact stellar X-ray sources written by leading experts in the field. It covers in detail the recent developments in X-ray and multi-wavelength observations, and the theory behind them.
