

CONTENTS

Preface	<i>page xi</i>
1 Introduction to materials modeling and simulation	1
1.1 Modeling and simulation	1
1.2 What is meant by computational materials science and engineering?	2
1.3 Scales in materials structure and behavior	3
1.4 How to develop models	5
1.5 Summary	7
PART ONE SOME BASICS	
2 The random-walk model	11
2.1 Random-walk model of diffusion	11
2.2 Connection to the diffusion coefficient	13
2.3 Bulk diffusion	18
2.4 A random-walk simulation	19
2.5 Random-walk models for materials	25
2.6 Summary	26
3 Simulation of finite systems	27
3.1 Sums of interacting pairs of objects	27
3.2 Perfect crystals	29
3.3 Cutoffs	31
3.4 Periodic boundary conditions	32
3.5 Implementation	34
3.6 Long-ranged potentials	35
3.7 Summary	36
3.8 Appendix	36
PART TWO ATOMS AND MOLECULES	
4 Electronic structure methods	45
4.1 Quantum mechanics of multielectron systems	46
4.2 Early density functional theories	47

4.3	The Hohenberg-Kohn theorem	51
4.4	Kohn-Sham method	51
4.5	The exchange-correlation functional	54
4.6	Wave functions	55
4.7	Pseudopotentials	57
4.8	Use of density functional theory	59
4.9	Summary	61
5	Interatomic potentials	62
5.1	The cohesive energy	62
5.2	Interatomic potentials	63
5.3	Pair potentials	67
5.4	Ionic materials	76
5.5	Metals	78
5.6	Covalent solids	84
5.7	Systems with mixed bonding	88
5.8	What we can simulate	89
5.9	Determining parameters in potentials	91
5.10	Summary	91
5.11	Appendix	92
6	Molecular dynamics	96
6.1	Basics of molecular dynamics for atomic systems	96
6.2	An example calculation	107
6.3	Velocity rescaling	116
6.4	Molecular dynamics in other ensembles	117
6.5	Accelerated dynamics	120
6.6	Limitations of molecular dynamics	122
6.7	Molecular dynamics in materials research	123
6.8	Summary	125
6.9	Appendix	125
7	The Monte Carlo method	131
7.1	Introduction	131
7.2	Ensemble averages	132
7.3	The Metropolis algorithm	134
7.4	The Ising model	139
7.5	Monte Carlo for atomic systems	145
7.6	Other ensembles	150
7.7	Time in a Monte Carlo simulation	154
7.8	Assessment of the Monte Carlo method	155
7.9	Uses of the Monte Carlo method in materials research	155

	Contents	vii
7.10 Summary	156	
7.11 Appendix	156	
8 Molecular and macromolecular systems	158	
8.1 Introduction	158	
8.2 Random-walk models of polymers	161	
8.3 Atomistic simulations of macromolecules	163	
8.4 Coarse-grained methods	172	
8.5 Lattice models for polymers and biomolecules	175	
8.6 Simulations of molecular and macromolecular materials	176	
8.7 Summary	177	
8.8 Appendix	178	
PART THREE MESOSCOPIC METHODS		
9 Kinetic Monte Carlo	183	
9.1 The kinetic Monte Carlo method	183	
9.2 Time in the kinetic Monte Carlo method	187	
9.3 Kinetic Monte Carlo calculations	189	
9.4 Applications	194	
9.5 Summary	195	
10 Monte Carlo methods at the mesoscale	196	
10.1 Modeling Grain Growth	196	
10.2 The Monte Carlo Potts model	198	
10.3 The N-fold way	202	
10.4 Example applications of the Potts model	205	
10.5 Applications in materials science and engineering	208	
10.6 Summary	210	
11 Cellular automata	211	
11.1 Basics of cellular automata	211	
11.2 Examples of cellular automata in two dimensions	215	
11.3 Lattice-gas methods	218	
11.4 Examples of cellular automata in materials research	219	
11.5 Relation to Monte Carlo	227	
11.6 Summary	227	
12 Phase-field methods	229	
12.1 Conserved and non-conserved order parameters	229	
12.2 Governing equations	230	

12.3	A one-dimensional phase-field calculation	233
12.4	Free energy of an interface	237
12.5	Local free-energy functions	238
12.6	Two examples	241
12.7	Other applications in materials research	244
12.8	Summary	244
12.9	Appendix	244
13	Mesoscale dynamics	249
13.1	Damped dynamics	249
13.2	Langevin dynamics	251
13.3	Simulation “entities” at the mesoscale	252
13.4	Dynamic models of grain growth	253
13.5	Discrete dislocation dynamics simulations	256
13.6	Summary	265
 PART FOUR SOME FINAL WORDS		
14	Materials selection and design	269
14.1	Integrated computational materials engineering	269
14.2	Concurrent materials design	271
14.3	Methods	273
14.4	Materials informatics	275
14.5	Summary	278
 PART FIVE APPENDICES		
A	Energy units, fundamental constants, and conversions	281
A.1	Fundamental constants	281
A.2	Units and energy conversions	281
B	A brief introduction to materials	283
B.1	Introduction	283
B.2	Crystallography	284
B.3	Defects	291
B.4	Point defects	291
B.5	Dislocations	292
B.6	Polycrystalline materials	302
B.7	Diffusion	306

	Contents	ix
C Mathematical background		310
C.1 Vectors and tensors		310
C.2 Taylor series		314
C.3 Complex numbers		315
C.4 Probability		317
C.5 Common functions		318
C.6 Functionals		321
D A brief summary of classical mechanics		324
D.1 Newton's equations		324
D.2 The Hamiltonian		326
D.3 Example: the harmonic oscillator		327
D.4 Central-force potentials		328
E Electrostatics		330
E.1 The force		330
E.2 Electrostatic potentials and energies		330
E.3 Distribution of charges: the multipole expansion		331
F Elements of quantum mechanics		334
F.1 History		334
F.2 Wave functions		335
F.3 The Schrödinger equation		336
F.4 Observables		336
F.5 Some solved problems		337
F.6 Atoms with more than one electron		342
F.7 Eigenvalues and eigenvectors		346
F.8 Multielectron systems		348
F.9 Quantum mechanics of periodic systems		349
F.10 Summary		349
G Statistical thermodynamics and kinetics		351
G.1 Basic thermodynamic quantities		351
G.2 Introduction to statistical thermodynamics		352
G.3 Macrostates versus microstates		352
G.4 Phase space and time averages		353
G.5 Ensembles		355
G.6 Fluctuations		362
G.7 Correlation functions		364
G.8 Kinetic rate theory		368
G.9 Summary		374

Contents

H	Linear elasticity	375
	H.1 Stress and strain	375
	H.2 Elastic constants	378
	H.3 Engineering stress and strain	378
	H.4 Isotropic solids	379
	H.5 Plastic strain	381
I	Introduction to computation	383
	I.1 Some basic concepts	383
	I.2 Random-number generators	383
	I.3 Binning	386
	I.4 Numerical derivatives	388
	I.5 Summary	391
	References	392
	Index	409
