Preface	<i>Page</i> xiii
1 What is thermodynamics?	1
1.1 Introduction	1
1.2 What is the problem?	1
1.3 A mechanical analogy	2
1.4 Limitations of the thermodynamic model	6
1.5 Summary	6
2 Defining our terms	8
2.1 Something is missing	8
2.2 Systems	8
2.3 Equilibrium	12
2.4 State variables	17
2.5 Phases and components	20
2.6 Processes	21
2.7 Summary	28
3 The first law of thermodynamics	31
3.1 Temperature and pressure scales	31
3.2 Internal energy	32
3.3 Energy transfers	35
3.4 The first law of thermodynamics	37
3.5 Enthalpy, the heat of reaction	46
3.6 How far have we got?	61
3.7 The model again	61
3.8 Summary	63
4 The second law of thermodynamics	65
4.1 Introduction	65
4.2 The problem restated	65
4.3 Thermodynamic potentials	66
4.4 Entropy	67
4.5 The fundamental equation	74

4.6	The USV surface	75
4.7	Those other forms of work	77
4.8	Applicability of the fundamental equation	78
4.9	Constraints and metastable states	79
4.10	The energy inequality expression	83
4.11	Entropy and heat capacity	85
4.12	A more useful thermodynamic potential	91
4.13	Gibbs and Helmholtz functions as work	94
4.14	Open systems	97
4.15	The meaning of entropy	103
4.16	A word about Carnot	107
4.17	The end of the road	107
4.18	Summary	108
5	Getting data	111
5.1	Introduction	111
5.2	What to measure?	112
5.3	Solution calorimetry	115
5.4	The third law	119
5.5	The problem resolved	125
5.6	Data at higher temperatures	133
5.7	Data at higher pressures	141
5.8	Other methods	145
5.9	Summary	149
6	Some simple applications	150
6.1	Introduction	150
6.2	Some properties of water	150
6.3	Simple phase diagrams	161
6.4	The slope of phase boundaries	165
6.5	Another example	171
6.6	Summary	175
7	Ideal solutions	176
7.1	Introduction	176
7.2	Measures of concentration	177
7.3	Properties of ideal solutions	180
7.4	Ideal solution laws	182
7.5	Ideal solution equations	187
7.6	Next step – the activity	196
7.7	Summary	196
8	Fugacity and activity	198
8.1	Fugacity	198
8.2	Activity	206

8.3	Standard states and activity coefficients	211
8.4	Effect of temperature and pressure on activities	224
8.5	Activities and standard states: an overall view	227
8.6	Summary	233
9	The equilibrium constant	234
9.1	Reactions in solution	234
9.2	Reactions at equilibrium	236
9.3	The most useful equation in thermodynamics	237
9.4	Special meanings for K	242
9.5	K in solid–solid reactions	250
9.6	Change of K with temperature I	252
9.7	Change of K with temperature II	257
9.8	Change of K with pressure	264
9.9	The amino acid example again	265
9.10	Some conventions regarding components	269
9.11	Summary	273
10	Real solutions	274
10.1	Introduction	274
10.2	Solution volumes	274
10.3	The infinite dilution standard state	284
10.4	Excess properties	287
10.5	Enthalpy and heat capacity	293
10.6	Gibbs energies	302
10.7	Margules equations	310
10.8	Beyond Margules	313
10.9	The Gibbs–Duhem equation	314
10.10	Summary	316
11	The phase rule	317
11.1	Introduction	317
11.2	Derivation of the phase rule	317
11.3	Components and species	321
11.4	Duhem’s theorem	326
11.5	Buffered systems	330
11.6	Summary	334
12	Redox reactions	335
12.1	Introduction	335
12.2	Electron transfer reactions	335
12.3	The role of oxygen	336
12.4	A simple electrolytic cell	338
12.5	The Nernst equation	341
12.6	Some necessary conventions	344

12.7	Measuring activities	347
12.8	Measuring redox conditions	349
12.9	<i>Eh</i> –pH diagrams	354
12.10	Oxygen fugacity	359
12.11	Redox reactions in organic chemistry	362
12.12	Summary	363
13	Equations of state	366
13.1	Introduction	366
13.2	The ideal gas	366
13.3	Two kinds of EoS	371
13.4	Cubic equations of state	371
13.5	The virial equation	378
13.6	Thermal equations of state	384
13.7	Other equations of state	391
13.8	Summary	394
14	Solid solutions	395
14.1	Introduction	395
14.2	Solid solutions	396
14.3	Activity coefficients in solid solutions	403
14.4	Summary	420
15	Electrolyte solutions	422
15.1	Introduction	422
15.2	Activities of electrolyte components	422
15.3	Numerical values for single-ion properties	436
15.4	The Debye–Hückel theory	440
15.5	Activity coefficients of neutral molecules	447
15.6	Ion association, ion pairs, and complexes	449
15.7	The Pitzer equations	451
15.8	The HKF model for aqueous electrolytes	461
15.9	Comparison of Pitzer and HKF models	471
16	Rock–water systems	473
16.1	Real problems	473
16.2	Is the sea saturated with calcium carbonate?	473
16.3	Determining the IAP – speciation	477
16.4	Combining the IAP and the K_{sp}	484
16.5	Mineral stability diagrams	487
16.6	Summary	497
17	Phase diagrams	499
17.1	What is a phase diagram?	499
17.2	Unary systems	500
17.3	Binary systems	507

17.4 Ternary systems	533
17.5 Summary	540
18 Process modeling	542
18.1 Introduction	542
18.2 Kinetics	543
18.3 Using the progress variable	550
18.4 Affinity and the progress variable	562
18.5 Final comment	572
Appendices	
A Constants and numerical values	574
B Standard state properties	576
C Some mathematics	586
C.1 Essential mathematics	586
C.2 Nonessential mathematics	590
D How to use SUPCRT92	601
E Computer programs	605
E.1 FORTRAN	605
E.2 MATLAB	612
F Symbols used	617
F.1 Variables	617
F.2 Superscripts	618
F.3 Subscripts	618
F.4 Comments on nonIUPAC usage	618
G A short history of thermodynamic constraints	620
G.1 Introduction	620
G.2 Schottky et al. (1929)	620
G.3 Tisza (1966)	622
G.4 Callen (1960)	622
G.5 Reiss (1965)	623
G.6 Weinreich (1968)	625
G.7 Summary	625
References	627
Index	641
