<i>Preface</i>	<i>page</i> xiii
<i>Acknowledgements</i>	xvi
1 Statistical physics of liquids	1
1.1 Basic statistical mechanics	3
1.1.1 Thermodynamic functions	3
1.1.2 The classical N -particle system	6
1.1.3 The BBGKY hierarchy equations	7
1.1.4 The Boltzmann equation	9
1.2 Equilibrium properties	11
1.2.1 The Gibbs H -theorem	12
1.2.2 The equilibrium ensembles	14
1.2.3 The static structure factor	19
1.2.4 Integral equations for $g(r)$	24
1.3 Time correlation functions	36
1.3.1 The density correlation function	38
1.3.2 The self-correlation function	41
1.3.3 The linear response function	47
1.4 Brownian motion	50
1.4.1 The Langevin equation	50
1.4.2 The Stokes–Einstein relation	53
<i>Appendix to Chapter 1</i>	55
A1.1 The Gibbs inequality	55
A1.2 The force–force correlation	55
A1.3 Brownian motion	56
A1.3.1 The noise correlation	56
A1.3.2 Evaluation of the integrals	57
2 The freezing transition	58
2.1 The density-functional approach	58
2.1.1 A thermodynamic extremum principle	60

Contents

2.1.2	An approximate free-energy functional	64
2.1.3	The Ramakrishnan–Yussouff model	68
2.2	Weighted density functionals	72
2.2.1	The modified weighted-density approximation	75
2.2.2	Gaussian density profiles	76
2.2.3	The hard-sphere system	78
2.3	Fundamental measure theory	85
2.3.1	Density-independent weight functions	86
2.3.2	The free-energy functional	88
2.4	Applications to other systems	90
2.4.1	Long-range interaction potentials	91
2.4.2	The solid–liquid interface	99
Appendix to Chapter 2		105
A2.1	Correlation functions for the inhomogeneous solid	105
A2.2	The Ramakrishnan–Yussouff model	106
A2.3	The weighted-density-functional approximation	109
A2.4	The modified weighted-density-functional approximation	113
A2.5	The Gaussian density profiles and phonon model	115
3	Crystal nucleation	117
3.1	Classical nucleation theory	117
3.1.1	The free-energy barrier	118
3.1.2	The nucleation rate	121
3.1.3	Heterogeneous nucleation	129
3.2	A simple nonclassical model	131
3.2.1	The critical nucleus	133
3.2.2	The free-energy barrier	134
3.3	The density-functional approach	137
3.3.1	The square-gradient approximation	137
3.3.2	The critical nucleus	141
3.3.3	The weighted-density-functional approach	145
3.4	Computer-simulation studies	150
3.4.1	Comparisons with CNT predictions	152
3.4.2	The structure of the nucleus	155
Appendix to Chapter 3		160
A3.1	The schematic model for nucleation	160
A3.1.1	Critical nucleus	160
A3.1.2	The free-energy barrier	161
A3.2	The excess free energy in the DFT model	162
4	The supercooled liquid	164
4.1	The liquid–glass transition	164
4.1.1	Characteristic temperatures of the glassy state	165

<i>Contents</i>		ix
4.1.2	The free-volume model	170
4.1.3	Self-diffusion and the Stokes–Einstein relation	171
4.2	Glass formation vs. crystallization	175
4.2.1	The minimum cooling rate	176
4.2.2	The kinetic spinodal and the Kauzmann paradox	177
4.3	The landscape paradigm	181
4.3.1	The potential-energy landscape	182
4.3.2	The free-energy landscape	188
4.4	Dynamical heterogeneities	192
4.4.1	Computer-simulation results	193
4.4.2	Dynamic length scales	198
5	Dynamics of collective modes	204
5.1	Conservation laws and dissipation	205
5.1.1	The microscopic balance equations	205
5.1.2	Euler equations of hydrodynamics	207
5.1.3	Dissipative equations of hydrodynamics	209
5.1.4	Tagged-particle dynamics	211
5.1.5	Two-component systems	212
5.2	Hydrodynamic correlation functions	215
5.2.1	Self-diffusion	217
5.2.2	Transport coefficients	218
5.3	Linear fluctuating hydrodynamics	225
5.3.1	The generalized Langevin equation	225
5.3.2	The liquid-state dynamics	236
5.4	Hydrodynamics of a solid	246
<i>Appendix to Chapter 5</i>		260
A5.1	The microscopic-balance equations	260
A5.1.1	The Euler equations	263
A5.1.2	The entropy-production rate	264
A5.2	The second fluctuation–dissipation relation	269
6	Nonlinear fluctuating hydrodynamics	271
6.1	Nonlinear Langevin equations	271
6.1.1	Coupling of collective modes	271
6.1.2	Nonlinear Langevin equations	274
6.2	The compressible liquid	287
6.2.1	The one-component fluid	287
6.2.2	The nonlinear diffusion equation	293
6.2.3	A two-component fluid	295
6.2.4	The solid state	300
6.3	Stochastic balance equations	303
6.3.1	Smoluchowski dynamics	303

6.3.2	Fokker–Planck dynamics	308
Appendix to Chapter 6		310
A6.1	The coarse-grained free energy	310
7	Renormalization of the dynamics	318
7.1	The Martin–Siggia–Rose theory	319
7.1.1	The MSR action functional	320
7.2	The compressible liquid	327
7.2.1	MSR theory for a compressible liquid	328
7.2.2	Correlation and response functions	330
7.3	Renormalization	334
7.3.1	Fluctuation–dissipation relations	335
7.3.2	Nonperturbative results	339
7.3.3	One-loop renormalization	343
Appendix to Chapter 7		348
A7.1	The Jacobian of MSR fields	350
A7.2	The MSR field theory	351
A7.3	Invariance of the MSR action	355
A7.4	The memory-function approach	357
A7.4.1	The projection-operator method	358
A7.4.2	The mode-coupling approximation	361
8	The ergodic–nonergodic transition	363
8.1	Mode-coupling theory	363
8.1.1	The schematic model	365
8.1.2	Effects of structure on dynamics	369
8.1.3	Tagged-particle dynamics	376
8.1.4	Dynamical heterogeneities and MCT	383
8.1.5	Linking DFT with MCT	388
8.1.6	Dynamic density-functional theory	391
8.2	Evidence from experiments	400
8.2.1	Testing with schematic MCT	400
8.2.2	Glass transition in colloids	406
8.2.3	Molecular-dynamics simulations	407
8.2.4	Discussion	409
8.3	Ergodicity-restoring mechanisms	411
8.3.1	Ergodic behavior in the NFH model	412
8.3.2	The hydrodynamic limit	414
8.3.3	Numerical solution of NFH equations	417
8.4	Spin-glass models	419
8.4.1	The p -spin interaction model	420
8.4.2	MCT and mean-field theories	426

Appendix to Chapter 8	430
A8.1 Calculation of the spring constant	430
A8.2 Field-theoretic treatment of the DDFT model	432
A8.3 The one-loop result for $\Sigma_{\hat{v}\hat{v}}(\mathbf{0}, \mathbf{0})$	442
9 The nonequilibrium dynamics	443
9.1 The nonequilibrium state	443
9.1.1 A generalized fluctuation–dissipation relation	443
9.1.2 Computer-simulation studies	444
9.2 The effective temperature	449
9.2.1 The phenomenological approach	451
9.2.2 A simple thermometer	451
9.3 A mean-field model	456
9.3.1 The mode-coupling approximation	459
9.3.2 The FDT regime	460
9.3.3 The aging regime	465
9.3.4 Quasi-ergodic behavior	469
9.4 Glassy aging dynamics	471
9.4.1 Thermalization	471
9.4.2 Aging dynamics: experiments	473
Appendix to Chapter 9	479
A9.1 The energy of the oscillator	479
A9.2 Evaluation of integrals	481
A9.2.1 Integral I_R for the FDT solution	481
A9.2.2 Integrals for the aging solution	482
10 The thermodynamic transition scenario	486
10.1 The entropy crisis	486
10.1.1 The Adam–Gibbs theory	487
10.1.2 Dynamics near T_K	488
10.2 First-order transitions	490
10.2.1 Metastable aperiodic structures	491
10.2.2 Random first-order transition theory	494
10.3 Self-generated disorder	498
10.3.1 Effective potential and overlap functions	498
10.3.2 A model calculation	501
10.4 Spontaneous breaking of ergodicity	505
10.4.1 The replica method for self-generated disorder	507
10.4.2 Free energy of the Replicated liquid	509
10.4.3 An example: The ϕ^4 model	514
10.5 The amorphous solid	519
10.5.1 The Mézard–Parisi model	522
