Palaeopathology

*Palaeopathology* is designed to help bone specialists with diagnosis of diseases in skeletal assemblages. It suggests an innovative method of arriving at a diagnosis in the skeleton by applying ‘operational definitions’. The aim is to ensure that all those who study bones will use the same criteria for diagnosing disease, which will enable valid comparisons to be made between studies. This book is based on modern clinical knowledge and provides background information so that readers understand the natural history of bone diseases, which will enable them to draw reliable conclusions from their observations. Details of bone metabolism and the fundamentals of basic pathology are also provided, as well as a comprehensive and up-to-date bibliography. A short chapter on epidemiology provides information on how best to analyze and present the results of a study of human remains.

Professor Tony Waldron teaches paleopathology at the Institute of Archaeology, University College London. The author of about 300 peer-reviewed papers in medical, scientific and archaeology journals, as well as books on occupational medicine and paleoepidemiology, Waldron is co-founder of the *International Journal of Osteoarchaeology* and served as co-editor for its first decade. He is a Fellow of the Royal College of Physicians of London, the Royal Society of Medicine, the Institute of Biology and the Royal Anthropological Institute.
Cambridge Manuals in Archaeology

General Editor
Graeme Barker, University of Cambridge

Advisory Editors
Elizabeth Slater, University of Liverpool
Peter Bogucki, Princeton University

Cambridge Manuals in Archaeology is a series of reference handbooks designed for an international audience of upper-level undergraduate and graduate students and professional archaeologists and archaeological scientists in universities, museums, research laboratories and field units. Each book includes a survey of current archaeological practice alongside essential reference material on contemporary techniques and methodology.

Books in the Series
Pottery in Archaeology, CLIVE ORTON, PAUL TYRES and ALAN VINCE
Vertebrate Taphonomy, R LEE LYMAN
Photography in Archaeology and Conservation, 2nd edition, PETER G DORRELL
Alluvial Geoarchaeology, A G BROWN
Shells, CHERYL CLAASEN
Sampling in Archaeology, CLIVE ORTON
Excavation, STEVE ROSKAMS
Teeth, 2nd edition, SIMON HILLSON
Lithics, 2nd edition, WILLIAM ANDREFFSKY JR
Geographical Information System in Archaeology, JAMES CONOLLY and MARK LAKE
Demography in Archaeology, ANDREW CHAMBERLAIN
Analytical Chemistry in Archaeology, A M POLLARD, C M BATT, B STERN and S M M YOUNG
Zooarchaeology, 2nd edition, ELIZABETH J REITZ and ELIZABETH S WING
Quantitative Paleozoology, R LEE LYMAN
Palaeopathology

Tony Waldron Institute of Archaeology, University College London
## CONTENTS

*List of Figures*  
*Preface*  

1. **Introduction and Diagnosis**  
   - Diagnosis in Palaeopathology  
   - Other Comparisons  
   - A Note on Health . . .  
   - . . . and Mummies

2. **Bone Metabolism and Pathology**  
   - Types of Bone  
   - The Bone Matrix  
   - Bone Cells and Cytokines  
   - Bone Mass  
   - Remodelling  
   - Bone Pathology  
   - Pathology, Pseudopathology and Normal Variation

3. **Diseases of Joints, Part 1**  
   - Osteoarthritis  
   - Precipitants of Osteoarthritis  
   - The Natural History of Osteoarthritis  
   - Diagnosis of Osteoarthritis  
   - Osteoarthritis at Individual Sites  
   - The Association Between Osteoarthritis and Other Conditions  
   - Rotator Cuff Disease and Intervertebral Disc Disease  
   - Schmorl’s Nodes
### 4. Diseases of Joints, Part 2
- Rheumatoid Arthritis
- The Natural History of Rheumatoid Arthritis
- Sero-Negative Arthropathies
- Erosive Osteoarthritis
- The Spondyloarthritides
- Ankylosing Spondylitis
- Reiter’s Syndrome (Reactive Spondyloarthropathy)
- Psoriatic Arthropathy
- Enteropathic Arthropathy
- Undifferentiated Spondyloarthritides
- Juvenile Arthritis
- Gout
- Bunions

### 5. Bone forming and DISH
- Bone Forming and Bone Formers
- Diffuse Idiopathic Skeletal Hyperostosis (DISH)
- Ossification in the Posterior Longitudinal Ligament
- Hyperostosis Frontalis Interna
- Heterotopic Ossification
- Osteopetrosis

### 6. Infectious Diseases
- Osteomyelitis
- Special Forms of Osteomyelitis
- Tuberculosis
- Leprosy
- Venereal Syphilis
- The Origins of Syphilis
- Changes in the Skeleton
- Poliomyelitis
- Smallpox
- Fungal Infections of Bone
- Parasitic Disease
- Non-Specific Infections

### 7. Metabolic Diseases
- Osteoporosis
- Paget’s Disease of Bone (PDB)
8. Trauma 138
Fractures and Dislocations 138
Fractures 141
  Treatment of Fractures 142
  Complications of Fractures 143
  Healing of fractures 146
  The Epidemiology of Fractures 148
  Comments of the Aetiology of Some Fractures 151
  Osteochondritis Dissecans (OCD) 153
Dislocations and Subluxations 155
  Dislocation of the Shoulder 155
Wounding 156
  Gunshot Wounds 157
Amputation 158
Trephination 161
The Autopsy 162
Legalised Trauma 165
  Beheading 165
  Hanging 165

9. Tumours 168
  Epidemiology of Bone Tumours 168
  The Diagnosis of Tumours in Human Remains 170
Benign Tumours 170
  Tumours Arising from Bone 171
  Tumours Arising from Cartilage 174
Malignant Tumours 177
  Primary Malignant Bone Tumours 178
  The Periosteal Response to Malignant Bone Tumours 178
  Ewing's Sarcoma 181
Metastatic Bone Tumours 184
  Diagnosing Secondary Tumours 189
## 10. Disorders of Growth and Development

LIST OF FIGURES

2.1. Diagram to show different phases of bone remodelling. page 18
2.2. Diagram of remodelling unit. 19
3.1. Diagram of normal synovial joint. 26
3.2. Model of aetiology of osteoarthritis. 29
3.3. Secondary osteoarthritis of the hip. 30
3.4. Osteoarthritis of the patello-femoral compartment of the knee. 32
3.5. Osteoarthritis of the hip. 32
3.6. Cervical vertebrae (C3–C5) with disc disease. 44
4.1. Diagram to show relationship of the different joint diseases. 47
4.2. Model of aetiology of rheumatoid arthritis. 50
4.3. Rheumatoid arthritis of the elbow. 52
4.4. Radiograph of erosive osteoarthritis. 55
4.5. Ankylosing spondylitis. 57
4.6. Model to show aetiology of reactive arthritis. 62
4.7. Radiograph of ankle. 69
4.8. Simplified diagram to show the differentiation between the various forms of erosive arthropathy. 70
5.1. Thoracic spine of Giso. 74
5.2. Two large plaques of heterotopic bone. 80
6.1. Posterior view of left femur with osteomyelitis. 86
6.2. Thoracic spine with tuberculosis. 93
6.3. Frontal bone of skull affected with syphilis. 106
6.4. Left and right tibia and femur from a presumptive case of polio. 110
7.1. Model of aetiology of Paget’s disease of bone. 125
8.1. Healed fracture of the right ankle. 144
8.2. Fourth lumbar vertebra with spondylolysis. 152
## List of Figures

8.3. Skull from Anglo-Saxon male showing healed wound. 156
8.4. Distal end of amputated femur from an eighteenth-century context. 160
8.5. Skeleton from late eighteenth or early nineteenth century. 164
9.1. Frontal bone showing the presence of a small button osteoma. 173
9.2. Skull of elderly female from eighteenth century context showing the presence of several holes. 186
10.1. Diagram to show four hypothetical cohorts of children. 194
10.2. Scheme for differentiating between the more common forms of dwarfism. 206
10.3. Diagram of a cross-section of the spine in scoliosis. 216
10.4. To determine the degree of spinal curvature from a radiograph. 217
11.1. Internal surface of male skull showing a pressure lesion. 229
12.1. Male skull from medieval period showing massive caries. 238
12.2. Male skull from medieval period showing dental calculus. 242
12.3. Scheme for differentiating different forms of apical lesions. 243
I entered palaeopathology via a very circuitous route, having previously had a background in anatomy, toxicology and epidemiology, although an interest in pathology was always present, having been greatly stimulated by the subject during my time as a medical student. My first hands-on experience with bones, however, was in collecting specimens for lead analysis when I was working at the University of Birmingham. We undertook the analysis of many hundreds of specimens until it became clear that the variation in lead levels that we were finding owed much more to contamination from the soil than to exposure during life, and I formed the view that it would be more profitable to see what information could be obtained from the bones themselves. When I moved to London to work at the London School of Hygiene and Tropical Medicine (LSHTM), I became very active in examining skeletal assemblages and some mummified material, and I had the good fortune to become acquainted with Don Brothwell at the Institute of Archaeology, which was just a few minutes walk around the corner from the LSHTM. He not only kindly gave me a corner of a desk, but invited me to take part in the teaching of the undergraduates and post-graduates at the Institute. I have had the great pleasure of teaching at the Institute now for many years, and this book is based very largely on the course of lectures in palaeopathology that I give to those taking the master’s courses.

Perhaps I should try to explain what this book is not. It is not a review of the palaeopathological literature, although, of course, references to this source are made as appropriate. Rather, the purpose of the book is to provide enough information to those who have no medical training to enable them to understand the nature and natural history of those diseases that they may encounter when they examine a collection of skeletons or other human remains. The book ought also to help them to recognise at least the majority of these conditions and perhaps allow them to categorise the most common. The text is firmly based on clinical evidence, because this is the only reliable source of information that permits us to differentiate normal
from abnormal. I do not subscribe to the view of some of my medical colleagues that those without medical training have no business dabbling in bone pathology, even in those long dead, but I do consider that medical training is not actually a hindrance in doing so. There are, however, great differences in arriving at a diagnosis in those long dead, compared with the living, and it is my experience that the significance of this difference is not always appreciated by those who come from non-medical backgrounds. I have tried to emphasize these difficulties and to suggest that it might be best if palaeopathologists were guided in their attempts at diagnosis by so-called operational definitions. These are more often used by epidemiologists than clinicians – although the latter use other guides such as flow charts or algorithms to help them. In the text I discuss, and attempt to justify, the use of operational definitions and, where possible, propose some which I consider helpful. I am not so naïve as to believe that bone specialists will fall on these operational definitions with relief if not with joy, and I am perfectly willing to discuss moderations of those that I have proposed and consider new definitions for some of the conditions that presently lack them. The definitions must, of course, be based on clinical evidence. Those who think otherwise are seriously in error, for if we do not use the signs that clinicians use to formulate disease states, what are we to fall back on? A disease that exists only in the mind of a particular palaeopathologist cannot really be said to exist anywhere else.

Many of my students and colleagues have helped to moderate or change my views over the years. One of the pleasures of teaching the young is that they come with uncluttered minds and are generally willing to be challenging and to question dogma; in this way both student and teacher learn. It was Harry S Truman who said that ‘the only things worth learning are the things you learn after you know it all’, and this is certainly true of most university lecturers, some more than others. I have learnt much from my students and from many colleagues but most especially from the late Dr David Birkett; Professors Don Brothwell, Simon Hillson and Don Ortner; and Dr Ann Stirland; I must reserve particular thanks for the late Dr Juliet Rogers with whom I had the very great pleasure of working and collaborating until her untimely death in 2001. I must also express my gratitude to Dr Don Resnick, whom I regret I have met only once, but whose monumental work on bone and joint radiology¹ has seldom been on my shelves while writing this book. It is one of the three very best textbooks that I have ever read,² and many unattributed opinions in this book have their origin in his pages. On this account, I would like to say that he is responsible

² The other two are Bradford Hill’s *Principles of medical statistics* and Donald Hunter’s *Diseases of occupations*.
for the errors that appear in these pages but lack the courage, and so I will have to
do the decent thing and accept responsibility for them myself. Perhaps there may be
an opportunity to correct them in the future.

I must also thank my long-suffering family, whose home life was – again – inter-
rupted to an unconscionable degree while I was writing the book, despite assurances
that it would never happen again. Virtually every flat surface in the house was covered
with piles of paper, which increased in size as time went on, and dark mutterings
were the normal means of communication for several months. At last, normality has
returned, and we can all eat around the dining table again. I am grateful to my son
Richard who has taken time out from his burgeoning career as a pop star to draw
two illustrations for me, and special thanks, as always, go to Gill, who valiantly read
every word, who found a good deal of amusement from the draft and who corrected
spelling and grammar assiduously. She also gamely supported the author through
dark patches and always encouraged and stimulated; I dedicate this book to her with
all my love.

London, 2008
