

## Index

- accelerator mass spectrometry, 150, 157  
 acoustic Doppler current profiler, 28  
   *actual recharge*, use of term, 166  
 adjoint-state methods, 46  
 Advanced Microwave Sensing Radiometer (AMSR-E), 41  
 Advanced Very High Resolution Radiometer (AVHRR), 40, 44  
*advective heat flow*, use of term, 167–168  
 age-dating methods, 152–159, 164  
 age distribution, 154  
 Agricultural Research Service, 34  
 agriculture, 10  
 Alluvial Basins region, 192–194  
 analytical models, for heat flow, 173–174, 178  
 analytical step-response function, 82  
 analytic-element method, 60  
 anion exclusion, 151  
 anions, as tracers, 151  
 antecedent recession curve, 119  
*apparent age*, use of term, 153  
 aquifer geometry, and geophysical techniques, 9  
 aquifers, confined, in groundwater-flow model, 59–60  
 aquifers, unconfined, water-table fluctuations in, 119–122  
 aquifer storage, 76  
 aquifer tests, for specific yield, 125  
 aquifer vulnerability analysis, 70–72  
 arid climate, 4, 192, 194, 196  
 arid regions: and CMB method, 143–145  
   and focused recharge, 75, 85  
   heat transport processes, 167, 171  
   and hydrograph separation, 95  
   phreatophytes, 76  
   and surface flow/runoff, 28  
   temperature-depth profiles, 171  
   and tracers, 138, 147, 164, 181  
   and water-budget uncertainty, 20  
 Arizona: Rillito Creek (Tucson), 174–175  
 assumptions: in age-dating approach, 153–154  
   as basis for methods, 14  
   consistent with model, 204  
   inherent in model, 43, 72, 74  
 Atlantic and Gulf Coastal Plain region, 201–202  
 atmospheric pressure, and WTF, 121  
 Australia: Monavale catchment, 56–57  
   Murray Basin, 145–146  
   Tomago sand beds (Newcastle), 131  
   Western Australia, 106–107  
 Australian National University, 150  
*available water capacity* (AWC), use of term, 37  
 AVI, 70  
*bank storage*, use of term, 75  
 base flow, 76–77, 94–95  
   estimating, 83–84  
 base-flow index (BFI), 77  
 Basin Characterization Model (BCM), 70, 192  
 best fit, 43, 46  
 bomb-pulse concentration peak, 162  
 bomb-pulse tracers, 137, 145, 147–150  
 borehole GPR, 99  
 bromide (Br), 137, 151  
 bucket models, 48–49, 63  
 California: Sagehen Creek watershed (Truckee), 64–65  
 California Irrigation Management Information System (CIMIS), 34  
 carbon-14 (<sup>14</sup>C), 62, 157–158, 195  
 change in storage, 102–103  
   in water-budget methods, 24–27, 34, 41  
   in WTF method, 118  
 chemical/isotopic streamflow hydrograph analysis, 91–94  
 chemical tracer methods, 136–165  
 China: Inner Mongolia, 149  
 chloride (Cl), 142–146, 151–152, 156–157, 164  
   atmospheric, 142  
   deposition, 137, 144, 157  
   environmental, 145–146  
   meteoric, 142  
   as tracer, 136–137  
 chloride concentration-depth profiles, 145  
 chloride mass-balance (CMB) age, 145  
 chloride mass-balance (CMB) equation, 143  
 chloride mass-balance (CMB) method, 142–145  
   for groundwater, 156–157  
   for unsaturated zone, 144  
   water-budget equation for, 142–143  
 chlorine-36 (<sup>36</sup>Cl), 136–137, 150, 152  
 chlorine-36 concentration-depth profile, 150  
 chlorofluorocarbons (CFCs), 136, 158–160, 163–164  
 classification system, for US groundwater regions, 189–190  
 climate, and recharge processes, 7–8  
 climatic regions, defined, 4  
 climatic trends, and recharge rates, 6–7  
 cokriging, 69  
 Colorado Plateau region, 195  
 Columbia Lava Plateau region, 194–195  
 column-drainage approach, for estimating specific yield, 124–125  
 combined watershed/groundwater-flow models, 63–65  
 Community Land Model (CLM), 39  
 comparison, of estimation methods, 182–189  
 computer models, 1, *see also names of models*  
 computer programs: for hydrograph separation, 86  
   for surface-water hydrograph analysis and flow-duration analysis, 95, *see also names of programs*  
 concentration-depth profiles, 138–139  
 conceptual models, 2, 74  
   consistency with assumptions, 204  
   development of, 5–11, 180, 190–191  
   for different groundwater regions, 189–203  
   and estimation methods, 5, 14, 180–204  
   incorrect, 12, 19, 182  
   informed by recharge estimates, 204  
   and integration of multiple factors, 11  
   and intersite comparison, 11  
   for recharge in urban settings, 202–203  
   reevaluation of, 182  
   and use of existing data, 11

- conceptual models (continued)  
 and water budget, 15–16, 42  
 of Yucca Mountain water flow,  
 193–194
- condensation, as heat transport  
 process, 167
- conductive heat flow*, use of term,  
 167–168
- contaminants in groundwater, as  
 tracers, 152
- contamination: and use of CFCs, 160  
 vulnerability to, 1, 11, 44, 70–72
- continuity equation, 57
- control volume: for local-scale  
 water-budget equation, 21, 28  
 for water-budget analysis, 15, 16
- crop coefficient, 32
- Darcy equation, 12, 28, 35, 50, 57,  
 59, 82, 107, 117
- Darcy methods, 74, 82, 116  
 and residual water-budget  
 method, 29–30  
 for saturated zone, 132–133  
 for unsaturated zone, 97, 107–110
- Darcy's Law, 132–133
- data collection, inaccuracies in, 12
- data sources, 21–22, 44
- Daymet database of precipitation  
 data, 32
- Deep Percolation Model (DPM),  
 55–56, 194
- delivery systems, for water supply  
 and treatment, 11
- del values, 147
- deuterium (D), 146–147
- diffuse drainage: in geothermal  
 zone, 169–171  
 in surficial zone, 172
- diffuse recharge, 181  
 and base flow, 76, 94–95  
 estimation methods for, 182  
 in groundwater-flow models,  
 58–59  
 and heat tracers, 169–172  
 and methods based on surface-  
 water data, 74  
 and models, 43  
 and unsaturated zone water-bud-  
 get models, 47  
 and upscaling, 66  
 use of term, 3, 166
- digital filtering, 87
- direct recharge*, use of term, 3
- discharge processes, and subsurface  
 geology, 9
- dissolved inorganic carbon (DIC),  
 157
- distillation, azeotropic/vacuum, 147
- distributed temperature sensors  
 (DTS), 169, 174
- downscaling, 188
- drainage: distinguished from re-  
 charge, 17  
 point estimates of, 116  
 use of term, 4, 97, 137–138, 166,  
 182
- DRASTIC, 70–71
- Drexel University Laboratory for  
 Climatology, 36
- due diligence, for application of  
 methods, 204
- dye tracers, 151–152
- dynamic feedback effect, 2, 65
- earthquakes, and WTF, 122
- eddy correlation, 23–24
- electrical conductivity, 144
- electromagnetic induction (EMI)  
 method, 99
- electromagnetic (EM) sensors, 98
- electron capture detector, 159, 161
- El Niño/Southern Oscillation, 8
- empirical models, 43, 134  
 and GIS, 69  
 and upscaling, 66–67
- end-member mixing analysis  
 (EMMA), 91–92  
 two-member model, 92
- energy-balance Bowen ratio (EBBR),  
 23–24
- England: Chalk and Triassic Sand-  
 stone aquifers, 105–106  
 Chalk aquifer, Fleam Dyke,  
 114–115
- entrapped air, 121, 159, 161
- ephemeral streams, 75, 173–174,  
 191–192, 196  
 and streamflow duration curves,  
 84–85
- EPIK, 70
- equilibrium-tension lysimeter (ETL),  
 112, 115
- error, sources of, 181–182
- error analysis, 12, 19–21, 181–182,  
*see also* uncertainty
- estimation equations, 32–34  
 in empirical models, 43  
 in water-budget methods, 31–32
- estimation methods: comparison of,  
 182–189  
 improper application of, 12  
 selection of, 13–14, 180–182,  
*see also* multiple methods  
*types of methods*
- EUROFLUX, 24
- evaporation: and del values, 147  
 as heat transport process, 167
- evapotranspiration, 97  
 measurement of, 23–24, 110  
 and remotely sensed data, 41  
 and source of evaporated water, 17
- in water-budget methods, 23–24,  
 32–34, 40–41  
 and WTF, 120–121
- evapotranspiration units, 41
- examples: agricultural field (Greno-  
 ble, France), 110  
 agricultural field (Maryland), 52  
 Basin and Range carbonate rock  
 aquifer system (Nevada-Utah),  
 70  
 Beaverdam Creek Basin (Mary-  
 land), 129–131  
 carbon-14 groundwater tracer, 158  
 central North Dakota, 133  
 Chalk and Triassic Sandstone  
 aquifers (England), 105–106  
 Chalk aquifer (Fleam Dyke, Eng-  
 land), 114–115  
 CMB method, 145–146  
 Columbia County (Wisconsin),  
 63, 115  
 combined model, 64–65  
 Darcy methods, 109–110  
 eastern Long Island, 30–31  
 Frenchman Flat (Nevada), 171–172  
 GIS, 70  
 groundwater-flow model, 60–62  
 groundwater vulnerability, 71–72  
 GSFLOW simulation, 64–65  
 heat-tracer techniques for focused  
 recharge, 174–177  
 historical groundwater tracers,  
 163–164  
 impacts of land use change on  
 groundwater recharge,  
 145–146  
 Inner Mongolia, 149  
 Las Cruces (New Mexico), 113–114  
 Lemhi River (Idaho), 79  
 local-scale application of water-  
 budget methods, 29–31  
 lysimetry, 113–115  
 mesoscale application of water-  
 budget methods, 35–38  
 methods based on Darcy equa-  
 tion, 133  
 Middle Rio Grande Basin (New  
 Mexico), 61–62, 158  
 Mirror Lake (New Hampshire),  
 61  
 models based on Richards equa-  
 tion, 52  
 Monavale catchment (Australia),  
 56–57  
 Murray Basin, Australia, 145–146  
 Namibia, 71–72  
 northwestern Illinois, 29–30  
 Orange County (Florida), 49–50  
 Panther Creek watershed (Il-  
 linois), 35  
 Pennsylvania streams, 90

- Pine River (Angus, Ontario, Canada), 176–177  
 Puget Sound Lowland (Washington), 55–56  
 recharge map (Minnesota), 67–68  
 regression techniques, 67–68  
 Rillito Creek (Tucson, Arizona), 174–175  
 Sagehen Creek watershed (Truckee, California), 64–65  
 Sevilleta Grasslands (New Mexico), 109–110  
 southern High Plains, US, 145–146  
 southwest India, 31  
 specific conductance as tracer, 92–93  
 streamflow hydrograph analyses, 90  
 stream water-budget method, 79  
 Sturgeon Falls (Ontario, Canada), 163–164  
 temperature–depth profiles, 171–172  
 Thornthwaite and Mather method, 36  
 Tomago sand beds (Newcastle, Australia), 131  
 tracer-profile method, 149  
 Trout Creek (north-central Nevada), 175–176  
 Truckee Meadows (Nevada), 60–61  
 unsaturated zone water-budget model, 49–50  
 watershed models, 55–57  
 West Maui (Hawaii), 36–38  
 Western Australia, 106–107  
 WTF method, 129–131  
 Yucca Mountain, Nevada, 193–194  
 ZFP method, 105–107
- exchange of groundwater and surface water, 74–76, 79–82, 94–95, 173–174, 176–177  
 existing data, use of, 11, 95, 182, 204
- FEHM, 168  
 field capacity, 125  
 financial constraints, 13, 181, 189  
 fine-wire thermocouple, 24  
 fixed-depth instruments, 141–142, 152  
 flooding, 76  
 Florida: Orange County, 49–50  
 flow net analysis, 82, 133, 156  
 flow nets, 29, 35, 82, 117, 132–133  
 flow processes, in unsaturated zone, 149  
 fluorescent dyes, 137  
 fluorobenzoic acids, 152  
 FLUXNET, 24  
 focused recharge, 3, 8, 43, 166, 181  
 estimation methods for, 182  
 in groundwater-flow models, 58–59  
 and heat tracers, 173–179  
 from losing stream, 76  
 and methods based on surface-water data, 74  
 and stream water-budget methods, 94  
 and upscaling, 66  
 fractured-rock systems, and WTF, 127–129  
 France: agricultural fields (Grenoble), 110  
 frequency of measurements, in WTF method, 119
- gaining stream: and stream water-budget method, 78  
 and temperature envelope, 173  
 use of term, 74–75  
 gamma-ray spectrometry, aircraft-mounted, 34  
 Gardner, W.R., 108, 142  
 gas chromatograph, 159, 161  
 gases, as tracers, 136–137, 152–154, 158–164  
 generic approaches, for tracer methods, 138  
 Geographical Information System (GIS), 36, 48, 50, 53, 66, 69–70, 72  
 geological weighing lysimeter, 135  
 geology: and recharge processes, 8–9  
 and recharge rates, 6–7  
 geophysical techniques, 9, 97–99, 204  
 for measurement of soil-water content, 98  
 for specific yield, 126–127  
 geostatistical techniques, 20  
 and upscaling, 66, 69  
*geothermal gradient*, use of term, 167  
*geothermal profile*, use of term, 167  
*geothermal zone*, 169–170  
 use of term, 167  
 Glaciated Appalachians region, 200  
 Glaciated Central region, 199–200  
 global optimization methods, in inverse modeling, 46  
 Global Soil Moisture Data Bank, 26  
 Göteborg, Sweden, 11, 202–203  
 gravimeter, 27  
 gravimetric measurement, 98  
 gravity-drain lysimeter, 112, 142  
 gravity measurements, 27, 135  
 Gravity Recovery and Climate Experiment (GRACE) satellites, 41  
 gross recharge, in WTF method, 118  
 ground-penetrating radar (GPR), 99  
*groundwater*, use of term, 4  
 groundwater chemistry data, 152  
 groundwater-flow equation, 57, 60, 87  
 groundwater-flow models, 29, 35, 43, 57–62, 156, 204  
 and CFC data, 160  
 calibration process, 45  
 as replacement for flow-net analyses, 133  
 for impacts of urbanization on recharge, 203  
 groundwater regions, US, 189–203  
 groundwater samples, 152  
 for chloride analysis, 157  
 groundwater/surface-water exchange, 74–76, 79–82, 94–95, 173–174, 176–177  
 groundwater tracers, 152–164  
*groundwater underflow*, use of term, 3  
 groundwater withdrawal or injection, 29  
 GSFLOW, 63–64
- Hawaii, 8  
 west Maui, 36–38  
 heat capacity of water, 168  
 heat dissipation probes (HDP), 99–100  
 heat flow, theory of, 167–169  
 heat-flow equation, 167  
 heat tracer methods, 166–179  
 helium-3 (<sup>3</sup>He) ingrowth method, 148  
 HELP3, 49  
 Henry's Law, 159, 161

 multiple methods, use of, 12, 29–30, 135, 182, 188, 204  
 Multi-Resolution Land Characteristics (MRLC) consortium, 44
- Namibia, 71–72  
 National Aeronautics and Space Administration (NASA) AQUA satellite mission, 41  
 National Atmospheric Deposition Program, 144  
 National Center for Atmospheric Research (NCAR) Hydrometeorological Networks, 21  
 National Center for Environmental Prediction Global Flux Archive, 40  
 National Cooperative Soil Survey, 44  
 National Land Cover Data 1992 (NLCD 92), 44  
 National Oceanic and Atmospheric Administration (NOAA): Geostationary Operational Environmental Satellite (GOES), 40–41  
 Multisensor Precipitation Estimation (MPE), 32  
 precipitation data, 21  
 Natural Resources Conservation Service (NRCS): SNOTEL network, 25  
 Soil Climate Analysis Network (SCAN), 27  
 SSURGO database, 37, 44  
*net infiltration*, use of term, 4  
 neutron meter, 106, 109–110, 113–115, 127, 142  
 neutron moderation method, 99  
 Nevada: Frenchman Flat, 171–172

- Trout Creek (north-central), 175–176  
 Truckee Meadows, 60–61  
 Yucca Mountain, 190–191  
 Nevada-Utah: Basin and Range carbonate rock aquifer system, 70  
 New Hampshire: Mirror Lake, 61  
 New Mexico: Las Cruces, 113–114  
 Middle Rio Grande (Albuquerque), 177  
 Middle Rio Grande Basin, 61–62, 158  
 Sevilleta Grasslands, 109–110  
 nitrate, 151  
 NOAH land surface model, 39, 41  
 nonlinear regression equations, 67  
 nonuniqueness, in inverse modeling, 46  
 North Dakota, 133  
 nuclear testing, 147, 149–150, 157  
 numerical models, 11–12  
 for groundwater flow, 82  
 for heat flow, 168–169, 173–174, 178  
 for specific yield, 127  
 of water and heat transport, 170  
*objective function*, use of term, 45–46  
 observation wells, 117, 125, 133–134  
 ocean tides, and WTF, 122  
 ocean water, 136  
 Ontario, Canada: Pine River (Angus), 176–177  
 overland flow, measurement of, 28  
 oxygen, stable isotope of ( $^{18}\text{O}$ ), 146–147  
 ozone depletion, 158  
 pan evaporation, 32–33  
 pan lysimeter, 112, 129  
 parameter estimation, 45, 49, 62, 158, 175, 177  
 PART, 90  
 peak-displacement method, 139–141, 145–150, 152–153, 161  
 pedotransfer functions, 101–102  
 Pennsylvania streamflow sites, 90  
 percent modern carbon (pmc), 157  
*percolation*, use of term, 4  
 PEST, 46, 169, 175, 177  
 physical methods: based on data  
 from saturated zone, 5, 117–135  
 based on data from unsaturated zone, 5, 164  
 physical realism, in combined models, 63  
 physical streamflow hydrograph analysis, 85–90  
 piezometer, 128–129, 132–133  
 piston-flow assumption, 139, 149, 154  
*piston-like flow*, 145  
 use of term, 139  
*point estimate*, 12–13, 44, 46, 69, 82, 94, 97, 112, 116, 152, 177, 181, 189, 195  
 use of term, 4  
 point sample, 154  
*pore water*, 139, 141–144, 147–149  
 use of term, 4  
*potential evapotranspiration* (PET), 36–37, 40, 47–48, 52–53, 55, 70–71  
 use of term, 32–34  
 potential recharge, 48, 70, 75–76, 144, 152  
 use of term, 3, 137–138, 166  
 power function model, 67, 70  
 precipitation: as dominant component in water budget, 7–8  
 measurement of, 19–23  
 temporal variability in, 7–8  
 in water-budget methods, 16–17, 21–23, 29–32, 40  
 precipitation events, duration and intensity of, 8  
 precipitation gauge, 21–23  
 precipitation rate, increasing, and increased recharge rates, 7  
 precipitation runoff modeling system (PRMS), 53–55, 64  
*preferential flow*, use of term, 139  
 pressure head, measurement of, 99–100  
 pressure transducers, 121  
 PRISM, 32, 70  
 pulse, water measurement as, 102–104  
 pulse tracer input, 137–139, 153  
 Purdue University, 150  
 purge and trap method, 159  
 RADARSAT-1, 41  
 radioactive waste storage, 193–194  
 radiometric methods, 148  
 radon, 91  
 rating tables, 28  
 ratio: of annual recharge to precipitation, 66  
 of recharge flux to hydraulic conductivity, 160  
 of recharge flux to porosity, 160  
 RECESS, 90  
 recession-curve displacement, 74, 85, 87–90  
 recession curves, 88, 118–119, 134  
 automated techniques for generating, 119  
 recharge: systematic and random variation in, 6–7  
 use of term, 3, 137–138, 182  
 recharge characteristics, of US groundwater regions, 189–203  
*recharge date*, use of term, 153  
 recharge estimates: as iterative process, 14  
 from artificial recharge operations, 2  
 from human-made drainage features, 2  
 inaccuracy in, 12  
 from irrigated areas, 2  
 spatial and temporal scales, 12–13  
 uncertainty in, 12  
 recharge maps, 71, 73  
*recharge potential*, use of term, 70  
 recharge processes, and spatial/temporal variability, 6–7  
 recharge rates: actual, 12  
 and aquifer vulnerability, 70–71  
 average, 135  
 distinguished from sustainable yield, 6  
 reconnaissance tracer sampling of soil or groundwater, 164  
*reference evapotranspiration*, use of term, 33  
 Ref-ET, 34  
 regression techniques, and upscaling, 66–67  
 relative hydraulic conductivity, 101  
 remotely sensed data: and GIS, 69–70  
 indirect use of, 41  
 remote sensing, 10, 204  
 for water-budget methods, 38–40  
 of stream temperatures, 169  
 remote-sensing tools, 4  
 residual water-budget method, 4, 15, 19  
 compared to Darcy method, 29–30  
 limitations of, 42  
 resistance probe, 142, 169  
 reverse Wieringermeer effect, 123  
 Richards equation, 138, 168  
 models based on, 50–52, 63  
 rooting depth, 102  
 root zone, 138  
 RORA, 90  
 ROSETTA, 51, 102  
 runoff diversions, urban, 10–11  
*safe yield*, use of term, 6  
 sap-flow meter, 24  
 satellite data, for evapotranspiration estimates, 40  
 satellite remote sensing, 39  
 screen fog collector, 23  
 Seabrook, NJ, 36  
 sediment samples, for chloride analyses, 144

- seepage measurement, 78–81, 94  
 seepage meter, 74, 79–81, 94  
 seepage run, 78–80  
 semiarid climate, 20, 192, 194–196, 199, 202  
   use of term, 4  
 semiarid region: and applied tracers, 150–151, 164  
   and chloride concentration, 141  
   and CMB method, 143–145  
   and focused recharge, 75, 85  
   and hydrograph separation, 95  
   phreatophytes, 76  
   and surface flow/runoff, 28  
   and water-budget uncertainty, 20  
 semihumid region, and lysimetry, 142  
 sensitivity analysis, 20, 57, 188  
 simulation models, 43–73  
 snow course, 34  
 snow pillow, 23  
 snow surveys, 25  
 snowfall gauge, 23  
 soil column, for water-budget analysis, 16–19  
 soil cores, for tracer analyses, 152  
 soils, and recharge processes, 8–9  
 soil samples, 150  
   for tracer concentrations, 141–142  
 Soils Landscapes of Canada database, 40  
 soil-solution sampler, 142  
 soil-suction lysimeter, 142  
 soil-vegetation-atmosphere transfer (SVAT) models, 39, 48  
 soil water-budget models, 47–50, 53, 133–134, 192, 198  
 soil-water content, measurement of, 26, 97–99, 142  
 soil-water content depth profile, 150  
 soil-water tension, 99  
 sonic anemometer, 24  
 spatial scale, 12–13  
   and selection of estimation methods, 188–189  
   for water-budget methods, 16  
 spatial/temporal variability, and recharge processes, 6–7, 19–20, 69, 80, 144, 176–177, 181–182, 189  
 specific conductance, 91–93  
 specific ion electrode, 151  
*specific vulnerability*, use of term, 70  
 specific yield, 122–127  
   and depth to water table, 123  
   field methods for estimating, 125–127  
   laboratory methods for estimating, 124–125  
   selection of appropriate values of, 127  
   and time following change in water-table height, 123–124  
 spring discharge measurements, 134  
 stable carbon isotope ratios, 158  
 stable isotope concentration profiles, 147  
 stable isotopes, as tracers, 152  
 Stanford Watershed Model, 52  
 static chamber, 24  
 STATSGO State Soil Geographic dataset, 44  
 STATSGO2 US General Soil Map, 44  
 steady-state assumption, 59, 63, 119, 124  
   of CMB method, 144–145  
 steady-state centrifuge method (SSCM), 101  
 stream stage, 28  
 stream temperatures, 173  
 stream water-budget method, 74, 77–79, 94  
   limitations of, 78–79  
 streambed seepage determination, 79–82  
 streamflow data, 74  
 streamflow duration, and temperature measurements, 179  
 streamflow duration curves, 74, 82–85, 94–95  
 streamflow hydrograph analyses, 74, 85–90, 94–95, 129, 134  
*streamtube*, use of term, 133  
 study goals, 13–14, 180  
 subhumid climate, 196, 199, 202  
   use of term, 4  
 subhumid region: and streamflow data, 74  
   and unsaturated-zone CMB methods, 144  
 submersible pressure transducers, 117  
 subsurface flow, in water-budget methods, 28–29, 35  
 subsurface heat flow, 166–169  
 subsurface lysimeter, 111–113  
 subsurface mountain-block recharge, 191  
 suction lysimeter, 147  
 sulfur hexafluoride (SF<sub>6</sub>), 136, 160–161  
 Surface Energy Balance Algorithm for Land (SEBAL), 39  
 surface flow, in water-budget methods, 27–28, 34–35  
*surficial zone*, use of term, 167  
*sustainable yield*, use of term, 6  
 SUTRA, 168  
 SWAT, 53  
 SWAT/MODFLOW, 63  
 temperature: in geothermal zone, 178  
   measurement of, 166  
   in surficial zone, 178  
   as tracer, 136 (, *see also* heat tracer methods)  
 temperature–depth profiles, 170–171, 178  
 temperature envelope, 173  
 temperature logging, 169  
 temperature measurements, for subsurface heat flow, 169  
 temperature sensors, fixed-depth, 169  
 temperature variations, and WTF, 122  
 temporal gravity method, 27, 34, 99, 126–127  
 temporal scales, 13, 181, 188  
 tensiometers, 99–100, 105, 108  
 thermal conductivity, 168  
   assumption of uniformity, 172  
   variation in, 170, 172, 178  
 thermistor device, 169  
 thermocouple device, 169  
 thermocouple psychrometer, 99–100  
 time-domain reflectometry (TDR), 98–99, 142  
 time history, of tracer application, 141  
 time intervals, 13  
 time scale, and selection of estimation methods, 182–188  
 time-series analyses, 117, 133–134  
 time-series approach, to WTF, 122  
 time-series procedure, automated, 131  
 time steps, in combined models, 63  
 tipping-bucket gauge, 21–23  
 tipping-bucket mechanism, for overland flow measurement, 28  
 TOPOG\_IRM, 56–57  
 topography, and recharge processes, 9  
 total recharge, in WTF method, 118  
 TOUGH2, 168  
 tracer application, 137, 141, 151  
 tracer-injection method, 28, 91, 93–94  
 tracer methods, 91, 136–165  
 tracer-profile method, 139–140, 147–148, 152–153, 161  
 tracers, 5, 136–138  
   accidentally introduced, 141
