<i>Preface</i>	<i>page xi</i>
1 Introduction	1
2 The basic principles	6
2.1 Pores and fractures	6
2.2 Geometrical characteristics	8
2.2.1 Porosity	8
2.2.2 Double porosity in a fracture–matrix medium	11
2.3 The transport velocity and mass conservation	12
2.3.1 Mass conservation	13
2.3.2 The incompressibility condition	14
2.3.3 The stream function	16
2.4 Darcy’s law	18
2.4.1 Hydrostatics	18
2.4.2 Interstitial flow through a uniform matrix	19
2.4.3 Permeability	21
2.4.4 Reduced pressure and buoyancy	23
2.4.5 Boundary conditions	24
2.5 Mechanical energy balances	27
2.5.1 Flow tubes and flow resistance	27
2.5.2 Energy balances	29
2.6 Two theorems	31
2.6.1 The uniqueness theorem	31
2.6.2 The minimum dissipation theorem	32
2.7 The thermal energy balance	33
2.8 Dissolved species balance	35
2.8.1 Rate-limiting steps and the solute source term	37
2.8.2 First-order reactions	40
2.9 Equations of state	41
	vii

viii	<i>Contents</i>	
2.10	Dispersion	43
2.10.1	Kinematics of dispersion	44
2.10.2	Dispersion in a steady plume	48
3	Patterns of flow	51
3.1	Flow in uniform permeable media	51
3.1.1	Flow constraints	52
3.1.2	Laplace's equation	56
3.1.3	Some local flow patterns	59
3.1.4	Two-dimensional surface aquifers	61
3.2	Three-dimensional surface aquifer flow	63
3.2.1	How do surface aquifers work?	63
3.2.2	Regional scale aquifer flow	67
3.2.3	An example: the aquifer in Kent County, Maryland	70
3.2.4	Scales of water table elevation; relaxation, emergence and recharge times	73
3.2.5	Groundwater age distribution in an aquifer	77
3.3	Dispersion and transport of marked fluid	78
3.3.1	Measurements of permeability variations in sandy aquifers	78
3.3.2	Measured dispersion of injected tracers over sub-kilometer scales	83
3.3.3	Flow through a spatially random permeability field	85
3.4	Layered media	93
3.4.1	Anisotropy produced by fine-scale layering	93
3.4.2	Flow across layering with scattered fracture bands or gaps	96
3.4.3	Confining layers in a surface aquifer	100
3.4.4	Mixing in more permeable lenses	105
3.5	Fracture–matrix or “crack and block” media	106
3.5.1	Reservoirs and conduits	109
3.5.2	Transport of passive solute in co-existing fracture and matrix block flows	111
3.5.3	A passive contaminant front in a fracture–matrix aquifer	113
3.5.4	Distributed solute entering across the water table	116
3.6	Flow transients	118
3.6.1	Diffusion of pressure	118
3.6.2	Pressure diffusion and de-gassing following seismic release	120
3.6.3	Diffusion of pressure in a fracture–matrix medium	121
4	Flows with buoyancy variations	125
4.1	The occurrence of thermally driven flows	125

<i>Contents</i>		ix
4.2	Buoyancy and the rotation vector	127
4.3	General properties of buoyancy-driven flows	130
4.3.1	Heat advection versus matrix diffusion: the Peclet number	131
4.3.2	Thermally driven flows: the Rayleigh number	133
4.4	Steady low Rayleigh number circulations	135
4.4.1	Slope convection with large aspect ratio l/h	135
4.4.2	Circulation in isolated, sloping permeable strata	137
4.4.3	Compact layered platforms and reefs at low Rayleigh numbers	140
4.4.4	Two-dimensional reefs or banks	143
4.5	Intermediate and high Rayleigh number plumes	146
4.5.1	Two-dimensional numerical solutions	146
4.5.2	How do these flows work?	153
4.5.3	Scaling analysis for two-dimensional flows	155
4.5.4	Circular platforms	158
4.5.5	Similarity solutions – two-dimensional plumes	159
4.5.6	The axi-symmetrical plume in a semi-infinite region	162
4.6	Salinity-driven flows	164
4.6.1	Freshwater lenses	165
4.6.2	Gravity currents in porous media	168
4.7	Thermal instabilities	170
4.7.1	Rayleigh–Darcy instability	171
4.7.2	A physical discussion	176
4.7.3	Related configurations	178
4.8	Thermo-haline circulations	180
4.8.1	Temperature destabilizing, salinity stabilizing	183
4.8.2	Both temperature and salinity stabilizing	185
4.8.3	Both temperature and salinity destabilizing	185
4.8.4	Temperature stabilizing, salinity destabilizing	185
4.8.5	Brine invasion beneath hypersaline lagoons	187
4.9	Instability of fronts	189
5	Patterns of reaction with flow	194
5.1	Simple reaction types	194
5.1.1	Dissolution	195
5.1.2	Combination	197
5.1.3	Replacement	199
5.2	An outline of flow-controlled reaction scenarios	202
5.2.1	The equilibration or reaction length	203

x	<i>Contents</i>	
	5.2.2 The reaction front scenario	204
	5.2.3 The gradient reaction scenario	206
	5.2.4 Mixing zones	208
5.3	Leaching or deposition of a mineral constituent	208
	5.3.1 Dissolution in a uniform flow	208
	5.3.2 Leaching in aquifer flow with infiltration across the water table	211
	5.3.3 Dissolution in a fracture–matrix medium	215
	5.3.4 The depletion time	217
5.4	The isothermal reaction front scenario	218
	5.4.1 The front propagation speed and the fluid–rock ratio	219
	5.4.2 Profiles in the reaction front	223
	5.4.3 Reaction fronts in fracture–matrix media	225
	5.4.4 Sorbing contaminant plumes	228
5.5	The gradient reaction scenario	235
	5.5.1 Dissolution and deposition rates in gradient reactions	239
	5.5.2 The rock alteration index	242
	5.5.3 Enhancement and destruction of porosity	243
5.6	The mixing zone scenario	247
5.7	Isotherm-following reactions	249
	5.7.1 The reaction zone	251
	5.7.2 Dehydration	253
5.8	Paleo-convection and dolomite formation in the Latemar Massif	255
5.9	Distributions of mineral alteration in Mississippi Valley-type deposits	260
6	Extensions and examples	264
	6.1 Extensions	264
	6.2 Examples	265
	6.2.1 Coastal salt wedges	265
	6.2.2 Permeability variations and the rotation vector	265
	6.2.3 Confined aquifers	266
	6.2.4 An unconfined or surface aquifer with a locally fractured confining layer	267
	6.2.5 The Hele-Shaw cell	267
	<i>Bibliography</i>	269
	<i>Index</i>	279
