Part I Interacting electrons: beyond the independent-particle picture	
1 The many-electron problem: introduction	1
Summary	1
1.1 The electronic structure problem	2
1.2 Why is this problem hard?	3
1.3 Why is the independent-electron picture so successful?	5
1.4 Development of theoretical approaches to the many-body problem	8
1.5 The many-body problem and computation	10
1.6 The scope of this book	13
Select further reading	14
2 Signatures of electron correlation	15
Summary	15
2.1 What is meant by correlation?	16
2.2 Ground-state and thermodynamic properties	17
2.3 Magnetism and local moments	20
2.4 Electron addition and removal: the bandgap problem and more	21
2.5 Satellites and sidebands	26
2.6 Particle–hole and collective excitations	29
2.7 The Kondo effect and heavy fermions	32
2.8 Mott insulators and metal–insulator transitions	33
2.9 Lower dimensions: stronger interaction effects	36
2.10 Wrap-up	39
3 Concepts and models for interacting electrons	40
Summary	40
3.1 The Wigner transition and the homogeneous electron system	40
3.2 The Mott transition and the Hubbard model	43
3.3 Magnetism and spin models	48

Cambridge University Press

Richard M. Martin, Lucia Reining and David M. Ceperley

Table of Contents

[More information](#)

viii	Contents	
3.4	Normal metals and Fermi liquid theory	49
3.5	The Kondo effect and the Anderson impurity model	51
3.6	The Luttinger theorem and the Friedel sum rule	54
	Select further reading	56
	Exercises	56
Part II Foundations of theory for many-body systems		
4	Mean fields and auxiliary systems	59
	Summary	59
4.1	The Hartree and Hartree–Fock approximations	61
4.2	Weiss mean field and the Curie–Weiss approximation	64
4.3	Density functional theory and the Kohn–Sham auxiliary system	65
4.4	The Kohn–Sham electronic structure	70
4.5	Extensions of the Kohn–Sham approach	72
4.6	Time-dependent density and current density functional theory	76
4.7	Symmetry breaking in mean-field approximations and beyond	78
4.8	Wrap-up	80
	Select further reading	80
	Exercises	81
5	Correlation functions	84
	Summary	84
5.1	Expectation values and correlation functions	85
5.2	Static one-electron properties	86
5.3	Static two-particle correlations: density correlations and the structure factor	90
5.4	Dynamic correlation functions	93
5.5	Response functions	98
5.6	The one-particle Green’s function	105
5.7	Useful quantities derived from the one-particle Green’s function	111
5.8	Two-particle Green’s functions	116
	Select further reading	120
	Exercises	120
6	Many-body wavefunctions	122
	Summary	122
6.1	Properties of the many-body wavefunction	123
6.2	Boundary conditions	124
6.3	The ground-state wavefunction of insulators	126
6.4	Correlation in two-electron systems	129
6.5	Trial function local energy, Feynman–Kac formula, and wavefunction quality	131
6.6	The pair product or Slater–Jastrow wavefunction	134

	Contents	ix
6.7	Beyond Slater determinants	139
	Exercises	141
7	Particles and quasi-particles	144
	Summary	144
7.1	Dynamical equations and Green's functions for coupled systems	145
7.2	The self-energy and the Dyson equation	148
7.3	Illustration: a single state coupled to a continuum	151
7.4	Interacting systems: the self-energy and spectral function	152
7.5	Quasi-particles	157
7.6	Quasi-particle equations	161
7.7	Separating different contributions to a Dyson equation	163
7.8	Wrap-up	165
	Select further reading	166
	Exercises	166
8	Functionals in many-particle physics	169
	Summary	169
8.1	Density functional theory and the Hartree–Fock approximation	171
8.2	Functionals of the Green's function G and self-energy Σ	174
8.3	Functionals of the screened interaction W	179
8.4	Generating functionals	182
8.5	Conservation laws and conserving approximations	187
8.6	Wrap-up	190
	Select further reading	190
	Exercises	191
Part III Many-body Green's function methods		
9	Many-body perturbation theory: expansion in the interaction	193
	Summary	193
9.1	The Coulomb interaction and perturbation theory	194
9.2	Connecting the interacting and non-interacting systems	199
9.3	Telling the story of particles: diagrams	202
9.4	Making the story easier: two theorems	206
9.5	Dyson equation for the one-particle Green's function, and the self-energy	212
9.6	Diagrammatic expansion at non-vanishing temperature	213
9.7	Self-consistent perturbation theory: from bare to dressed building blocks	215
9.8	The Luttinger–Ward functional	217
9.9	Wrap-up	219
	Select further reading	219
	Exercises	220

x	Contents	
10	Many-body perturbation theory via functional derivatives	222
	Summary	222
10.1	The equation of motion	223
10.2	The functional derivative approach	226
10.3	Dyson equations	228
10.4	Conservation laws	231
10.5	A starting point for approximations	234
10.6	Wrap-up	242
	Select further reading	243
	Exercises	243
11	The RPA and the GW approximation for the self-energy	245
	Summary	245
11.1	Hedin's equations	246
11.2	Neglecting vertex corrections in the polarizability: the RPA	251
11.3	Neglecting vertex corrections in the self-energy: the GW approximation	253
11.4	Link between the GWA and static mean-field approaches	260
11.5	Ground-state properties from the GWA	262
11.6	The GWA in the homogeneous electron gas	265
11.7	The GWA in small model systems	272
11.8	Wrap-up	277
	Select further reading	278
	Exercises	278
12	GWA calculations in practice	280
	Summary	280
12.1	The task: a summary	281
12.2	Frequently used approximations	283
12.3	Core and valence	289
12.4	Different levels of self-consistency	292
12.5	Frequency integrations	298
12.6	GW calculations in a basis	302
12.7	Scaling and convergence	306
12.8	Wrap-up	308
	Select further reading	309
	Exercises	310
13	GWA calculations: illustrative results	311
	Summary	311
13.1	From the HEG to a real semiconductor: silicon as a prototype system	312
13.2	Materials properties in the GWA: an overview	319
13.3	Energy levels in finite and low-dimensional systems	326
13.4	Transition metals and their oxides	329
13.5	GW results for the ground state	337

	Contents	xi
13.6	A comment on temperature	341
13.7	Wrap-up	343
	Select further reading	343
	Exercises	344
14	RPA and beyond: the Bethe–Salpeter equation	345
	Summary	345
14.1	The two-particle correlation function and measurable quantities	346
14.2	The two-particle correlation function: basic relations	348
14.3	The RPA: what can it yield?	350
14.4	Beyond the RPA: spin and frequency structure of the BSE	353
14.5	The Bethe–Salpeter equation in the GW approximation	355
14.6	A two-body Schrödinger equation	357
14.7	Importance and analysis of electron–hole interaction effects	361
14.8	Bethe–Salpeter calculations in practice	368
14.9	Applications	372
14.10	Extensions	379
14.11	Linear response using Green’s functions or density functionals	382
14.12	Wrap-up	385
	Select further reading	387
	Exercises	387
15	Beyond the GW approximation	389
	Summary	389
15.1	The need to go beyond GW: analysis and observations	391
15.2	Iterating Hedin’s equations	393
15.3	Effects of vertex corrections	394
15.4	The T-matrix and related approximations	399
15.5	Beyond the T-matrix approximation: combining channels	402
15.6	T-matrix and related approaches in practice	406
15.7	Cumulants in electron spectroscopy	410
15.8	Use of exact constraints	415
15.9	Retrospective and outlook	417
	Select further reading	418
	Exercises	419
16	Dynamical mean-field theory	421
	Summary	421
16.1	Auxiliary systems and embedding in Green’s function methods	423
16.2	Overview of DMFT	425
16.3	Expansion around an atomic limit: low energy scales and strong temperature dependence	429
16.4	Background for mean-field theories and auxiliary systems	431
16.5	Dynamical mean-field equations	435

xii	Contents	
16.6	Self-energy functional and variational equations	441
16.7	Static properties and density matrix embedding	442
16.8	Single-site DMFA in a two-site model	444
16.9	The Mott transition in infinite dimensions	445
16.10	Hybridized bands and consequences for the Mott transition	450
16.11	Interacting bands and spin transitions	451
16.12	Wrap-up	453
	Select further reading	454
	Exercises	454
17	Beyond the single-site approximation in DMFT	457
	Summary	457
17.1	Supercells and clusters	458
17.2	Cellular DMFA	460
17.3	Dynamic cluster approximation	463
17.4	Variational cluster and nested cluster approximations	466
17.5	Extended DMFT and auxiliary bosons	467
17.6	Results for Hubbard models in one, two, and three dimensions	470
17.7	Wrap-up	475
	Select further reading	476
	Exercises	477
18	Solvers for embedded systems	479
	Summary	479
18.1	The problem(s) to be solved	480
18.2	Exact diagonalization and related methods	481
18.3	Path-integral formulation in terms of the action	483
18.4	Auxiliary-field methods and the Hirsch–Fye algorithm	485
18.5	CTQMC: expansion in the interaction	487
18.6	CTQMC: expansion in the hybridization	491
18.7	Dynamical interactions in CTQMC	496
18.8	Other methods	498
18.9	Wrap-up	499
	Select further reading	500
	Exercises	500
19	Characteristic hamiltonians for solids with d and f states	502
	Summary	502
19.1	Transition elements: atomic-like behavior and local moments	503
19.2	Hamiltonian in a localized basis: crystal fields, bands, Mott–Hubbard vs. charge transfer	507
19.3	Effective interaction hamiltonian	512
19.4	Identification of localized orbitals	513

Contents	xiii
19.5 Combining DMFT and DFT	515
19.6 Static mean-field approximations: DFT+U, etc.	522
19.7 Wrap-up	525
Select further reading	525
Exercises	526
20 Examples of calculations for solids with <i>d</i> and <i>f</i> states	527
Summary	527
20.1 Kondo effect in realistic multi-orbital problems	528
20.2 Lanthanides – magnetism, volume collapse, heavy fermions, mixed valence, etc.	529
20.3 Actinides – transition from band to localized	536
20.4 Transition metals – local moments and ferromagnetism: Fe and Ni	537
20.5 Transition metal oxides: overview	540
20.6 Vanadium compounds and metal–insulator transitions	541
20.7 NiO – charge-transfer insulator, antiferromagnetism, and doping	543
20.8 MnO – metal–insulator and spin transitions	547
20.9 Wrap-up	549
Select further reading	551
Exercises	551
21 Combining Green’s functions approaches: an outlook	553
Summary	553
21.1 Taking advantage of different Green’s function methods	555
21.2 Partitioning the system	557
21.3 Combining different levels of diagrammatic approaches	559
21.4 Combining Green’s function methods: GW and DMFT	561
21.5 Dynamical interactions and constrained RPA	568
21.6 Consequences of dynamical interactions	570
21.7 Diagrammatic extensions: dynamical vertex approximation and dual fermions	571
21.8 Wrap-up	574
Select further reading	574
Exercises	575
Part IV Stochastic methods	
22 Introduction to stochastic methods	577
Summary	577
22.1 Simulations	578
22.2 Random walks and Markov chains	579
22.3 The Metropolis Monte Carlo method	581
22.4 Computing error bars	583

xiv	Contents	
22.5	The “heat bath” algorithm	586
22.6	Remarks	587
	Select further reading	588
	Exercises	588
23	Variational Monte Carlo	590
	Summary	590
23.1	Details of the variational Monte Carlo method	592
23.2	Optimizing trial wavefunctions	596
23.3	The momentum distribution and single-particle density matrix	598
23.4	Non-local pseudopotentials	599
23.5	Finite-size effects	601
23.6	VMC for lattice models	603
23.7	Excitations and orthogonality	603
23.8	Strengths and weaknesses of VMC	606
	Select further reading	607
	Exercises	608
24	Projector quantum Monte Carlo	609
	Summary	609
24.1	Types and properties of projectors	610
24.2	The diffusion Monte Carlo method	612
24.3	Exact fermion methods: the sign or phase problem	621
24.4	The fixed-node and fixed-phase methods	623
24.5	Mixed estimators, exact estimators, and the overlap	628
24.6	Non-local pseudopotentials in PMC	630
24.7	Projector auxiliary-field quantum Monte Carlo methods	632
24.8	Applications of projector MC	636
24.9	The pluses and minuses of projector MC	639
	Select further reading	642
	Exercises	642
25	Path-integral Monte Carlo	644
	Summary	644
25.1	The path-integral representation	645
25.2	Exchange of localized electrons	650
25.3	Quantum statistics and PIMC	652
25.4	Ground-state path integrals (GSPI)	659
25.5	Finite-temperature QMC for the Hubbard model	662
25.6	Estimating real-time correlation functions	665
25.7	Correlation-function QMC for excitations	669
	Select further reading	672
	Exercises	673
26	Concluding remarks	674

Part V Appendices

Appendix A	Second quantization	677
	Summary	677
	A.1 First quantization	677
	A.2 Second quantization	678
	Select further reading	682
Appendix B	Pictures	683
	Summary	683
	B.1 Schrödinger picture	684
	B.2 Heisenberg picture	684
	B.3 Interaction picture	686
	Select further reading	689
	Exercises	689
Appendix C	Green's functions: general properties	690
	Summary	690
	C.1 Green's functions for differential equations	690
	C.2 Fourier transforms and spectral representations	691
	C.3 Frequency integrals	693
	C.4 From many-body to few-body Green's functions	695
	C.5 The thermodynamic limit	696
	Select further reading	697
	Exercises	697
Appendix D	Matsubara formulation for Green's functions for $T \neq 0$	699
	Summary	699
	D.1 Green's functions at $T \neq 0$: Matsubara frequencies	699
	D.2 Analytic properties in the complex-frequency plane	702
	D.3 Illustration of the structure of $G^0(i\omega_n)$ and $G^0(\tau)$	705
	D.4 The grand potential Ω	707
	D.5 Transformation to real frequencies	709
	Select further reading	709
	Exercises	709
Appendix E	Time ordering, contours, and non-equilibrium	710
	Summary	710
	E.1 The task	710
	E.2 The contour interpretation	710
	E.3 Contours for all purposes	712
	Select further reading	714
Appendix F	Hedin's equations in a basis	715
	Summary	715
	F.1 Generalization of Hedin's equations	715

xvi	Contents	
F.2	Hedin's equations in a basis	717
	Select further reading	717
Appendix G	Unique solutions in Green's function theory	719
	Summary	719
G.1	Which G^0 ? Boundary conditions in time	719
G.2	Which G ? Self-consistent Dyson equations	720
G.3	Convergence of perturbation expansions and consequences	721
	Select further reading	722
	Exercises	722
Appendix H	Properties of functionals	724
	Summary	724
H.1	Functionals and functional equations	724
H.2	Legendre transformations and invertibility	725
H.3	Examples of functionals for the total energy in Kohn–Sham DFT calculations	726
H.4	Free-energy functionals for spin systems and proof of invertibility	727
H.5	Extension to quantum spins and density functional theory	729
	Select further reading	730
	Exercises	730
Appendix I	Auxiliary systems and constrained search	731
	Summary	731
I.1	Auxiliary system to reproduce selected quantities	731
I.2	Constrained search with an interacting auxiliary system	732
	Exercises	734
Appendix J	Derivation of the Luttinger theorem	735
	Summary	735
	Select further reading	737
	Exercises	738
Appendix K	Gutzwiller and Hubbard approaches	739
	Summary	739
K.1	Gutzwiller approach in terms of the wavefunction	740
K.2	Hubbard approach in terms of the Green's function	742
K.3	Two scenarios for the Mott transition	747
	Select further reading	748
	Exercises	748
