List of contributors vii
Foreword by Robert M. May (Lord May of Oxford) xi
Preface xv

1 Introduction: scaling biodiversity – what is the problem?
   David Storch, Pablo A. Marquet and James H. Brown 1

PART I Spatial scaling of species richness and distribution 13
2 Species–area curves and the geometry of nature
   Michael W. Palmer 15
3 The distribution of species: occupancy, scale, and rarity
   Fangliang He and Rick Condit 32
4 Species distribution patterns, diversity scaling and testing for
   fractals in southern African birds
   Jack J. Lennon, William E. Kunin, Stephen Hartley
   and Kevin J. Gaston 51
5 Geometry of species distributions: random clustering and scale
   invariance
   Arnošt L. Šízlíng and David Storch 77
6 Toward a mechanistic basis for a unified theory of spatial
   structure in ecological communities at multiple spatial scales
   John Harte 101

PART II Alternative measures of biodiversity: taxonomy,
   phylogeny, and turnover 127
7 Biodiversity scaling relationships: are microorganisms
   fundamentally different?
   Jessica Green and Brendan J. M. Bohannan 129
8 The importance of phylogenetic structure in biodiversity
   studies
   Jérôme Chave, Guillem Chust and Christophe Thébaud 150
### Table of Contents

9  On the quantification of local variation in biodiversity scaling using wavelets  
   *Timothy H. Keitt*  
   Page 168

10  The scaling of spatial turnover: pruning the thicket  
    *Kevin J. Gaston, Karl L. Evans and Jack J. Lennon*  
    Page 181

#### PART III  Scaling of biological diversity with energy and the latitudinal biodiversity gradient  

11  Climate and diversity: the role of history  
    *Andrew Clarke*  
    Page 225

12  Inverse latitudinal gradients in species diversity  
    *Pavel Kindlmann, Iva Schödelbauerová and Anthony F. G. Dixon*  
    Page 246

13  Regional-to-global patterns of biodiversity, and what they have to say about mechanisms  
    *David J. Currie*  
    Page 258

14  Recasting the species–energy hypothesis: the different roles of kinetic and potential energy in regulating biodiversity  
    *Andrew P. Allen, James F. Gillooly and James H. Brown*  
    Page 283

15  Scaling species richness and distribution: uniting the species–area and species–energy relationships  
    *David Storch, Arnošt L. Šizling and Kevin J. Gaston*  
    Page 300

#### PART IV  Processes, perspectives, and syntheses  

16  Spatiotemporal scaling of species richness: patterns, processes, and implications  
    *Ethan P. White*  
    Page 325

17  Scaling biodiversity under neutrality  
    *Luís Borda-da-Água, Stephen P. Hubbell and Fangliang He*  
    Page 347

18  General patterns in plant invasions: a family of quasi-neutral models  
    *Tomáš Herben*  
    Page 376

19  Extinction and population scaling  
    *William E. Kunin*  
    Page 396

20  Survival of species in patchy landscapes: percolation in space and time  
    *Beáta Oborny, György Szabó and Géza Meszéna*  
    Page 409

21  Biodiversity power laws  
    *Pablo A. Marquet, Sebastian R. Abades and Fabio A. Labra*  
    Page 441
