

## Star index

---

Stars are arranged by the Latin genitive of their constellation of residence, with other star names interspersed alphabetically. Within a constellation, Bayer Greek letters are given first, followed by Roman letters, Flamsteed numbers, variable stars arranged in traditional order (see Section 1.11), and then other names that take on genitive form. Stellar spectra are indicated by an asterisk. The best-known proper names have priority over their Greek-letter names. Spectra of the Sun and of nebulae are included as well.

Wolf–Rayet stars, 81–82, 110, 290, 370  
of planetary nebulae, 329–330  
spectra, kinds, and classes of, 296–298  
supernovae from, 371  
Wollaston, William, 70  
X-ray bursters, 333, 340  
X-ray stars, 333  
X-rays, 15  
Y stars, 93, 95, 100, 160–161  
yellow hypergiants, 91, 178, 185, 211–212,  
215, 223, 359  
YHG stars, *see* yellow hypergiants  
YM 29, 365  
Z Andromedae stars, *see* symbiotic stars  
Z Camelopardalis stars, *see* dwarf novae  
ZAMS, *see* zero-age main sequence  
Zanstra, Hermann, 305, 324  
Zanstra mechanism, 305–310, 324–326  
Zanstra temperatures, 324–326  
Zeeman effect, 202, 252  
zero-age main sequence, 348, 350  
Zodiac, 5, 8  
zodiacal light, 22, 256  
zone of avoidance, 267, 281  
Zwicky, Fritz, 370  
ZZ Ceti stars, 289
