Preface	xiii
Thanks	xv
1 What Gödel's Theorems say	1
Basic arithmetic · Incompleteness · More incompleteness · Some implications? · The unprovability of consistency · More implications? · What's next?	
2 Functions and enumerations	8
Kinds of function · Characteristic functions · Enumerable sets · Enumerating pairs of numbers · An indenumerable set: Cantor's theorem	
3 Effective computability	14
Effectively computable functions · Effectively decidable properties and sets · Effective enumerability · Another way of defining e.e. sets of numbers · The Basic Theorem about e.e. sets	
4 Effectively axiomatized theories	25
Formalization as an ideal · Formalized languages · Formalized theories · More definitions · The effective enumerability of theorems · Negation-complete theories are decidable	
5 Capturing numerical properties	36
Three remarks on notation · The language L_A · A quick remark about truth · Expressing numerical properties and functions · Capturing numerical properties and functions · Expressing vs. capturing: keeping the distinction clear	
6 The truths of arithmetic	46
Sufficiently expressive languages · The truths of a sufficiently expressive language · Unaxiomatizability · An incompleteness theorem	
7 Sufficiently strong arithmetics	49
The idea of a 'sufficiently strong' theory · An undecidability theorem · Another incompleteness theorem	
	vii

Contents	
8	Interlude: Taking stock 53
	Comparing incompleteness arguments · A road-map
9	Induction 56
	The basic principle · Another version of the induction principle · Induction and relations · Rule, schema, or axiom?
10	Two formalized arithmetics 62
	BA, Baby Arithmetic · BA is negation-complete · Q, Robinson Arithmetic · Which logic? · Q is not complete · Why Q is interesting
11	What Q can prove 71
	Capturing <i>less-than-or-equal-to</i> in Q · ‘ \leq ’ and bounded quantifiers · Q is order-adequate · Q can correctly decide all Δ_0 sentences · Σ_1 and Π_1 wffs · Q is Σ_1 -complete · Intriguing corollaries · Proving Q is order-adequate
12	$\mathsf{I}\Delta_0$, an arithmetic with induction 83
	The formal Induction Schema · Introducing $\mathsf{I}\Delta_0$ · What $\mathsf{I}\Delta_0$ can prove · $\mathsf{I}\Delta_0$ is not complete · On to $\mathsf{I}\Sigma_1$
13	First-order Peano Arithmetic 90
	Being generous with induction · Summary overview of PA · Hoping for completeness · Is PA consistent?
14	Primitive recursive functions 97
	Introducing the primitive recursive functions · Defining the p.r. functions more carefully · An aside about extensionality · The p.r. functions are computable · Not all computable numerical functions are p.r. · Defining p.r. properties and relations · Building more p.r. functions and relations · Further examples
15	L_A can express every p.r. function 113
	Starting the proof · The idea of a β -function · Finishing the proof · The p.r. functions and relations are Σ_1 -expressible
16	Capturing functions 119
	Capturing defined · ‘Weak’ capturing · ‘Strong’ capturing
17	Q is p.r. adequate 124
	The idea of p.r. adequacy · Starting the proof · Completing the proof · All p.r. functions can be captured in Q by Σ_1 wffs
18	Interlude: A very little about <i>Principia</i> 130
	<i>Principia</i> ’s logicism · Gödel’s impact · Another road-map

	Contents
19 The arithmetization of syntax	136
Gödel numbering · Acceptable coding schemes · Coding sequences · <i>Term</i> , <i>Atom</i> , <i>Wff</i> , <i>Sent</i> and <i>Prf</i> are p.r. · Some cute notation for Gödel numbers · The idea of diagonalization	
20 Arithmetization in more detail	144
The concatenation function · Proving that <i>Term</i> is p.r. · Proving that <i>Atom</i> , <i>Wff</i> and <i>Sent</i> are p.r. · Towards proving <i>Prf</i> is p.r.	
21 PA is incomplete	152
Reminders · ‘G is true if and only if it is unprovable’ · PA is incomplete: the semantic argument · ‘There is an undecidable sentence of Goldbach type’ · Starting the syntactic argument for incompleteness · ω -incompleteness, ω -inconsistency · Finishing the syntactic argument · Canonical Gödel sen- tences and what they say	
22 Gödel's First Theorem	161
Generalizing the semantic argument · Incompleteness · Generalizing the syntactic argument · The First Theorem	
23 Interlude: About the First Theorem	167
What we have proved · Some ways to argue that G_T is true · What doesn't follow from incompleteness · What does follow from incompleteness? · What's next?	
24 The Diagonalization Lemma	177
Provability predicates · An easy theorem about provability predicates · Proving $G \leftrightarrow \neg \text{Prov}(\ulcorner G \urcorner)$ · The Diagonalization Lemma · Incompleteness again · ‘Gödel sentences’ again · Capturing provability?	
25 Rosser's proof	185
Σ_1 -soundness and 1-consistency · Rosser's construction: the basic idea · The Gödel-Rosser Theorem · Improving the theorem	
26 Broadening the scope	191
Generalizing beyond p.r. axiomatized theories · True Basic Arithmetic can't be axiomatized · Generalizing beyond overtly arithmetic theories · A word of warning	
27 Tarski's Theorem	197
Truth-predicates, truth-theories · The undefinability of truth · Tarski's Theorem: the inexpressibility of truth · Capturing and expressing again · The Master Argument?	

Contents

28	Speed-up	201
	The length of proofs · The idea of speed-up · Long proofs, via diagonalization	
29	Second-order arithmetics	204
	Second-order syntax · Second-order semantics · The Induction Axiom again · ‘Neat’ second-order arithmetics · Introducing PA_2 · Categoricity · Incompleteness and categoricity · Another arithmetic · Speed-up again	
30	Interlude: Incompleteness and Isaacson’s Thesis	219
	Taking stock · The unprovability-in- PA of Goodstein’s Theorem · An aside on proving the Kirby-Paris Theorem · Isaacson’s Thesis · Ever upwards · Ancestral arithmetic	
31	Gödel’s Second Theorem for PA	233
	Defining Con · The Formalized First Theorem in PA · The Second Theorem for PA · On ω -incompleteness and ω -consistency again · So near, yet so far · How should we interpret the Second Theorem?	
32	On the ‘unprovability of consistency’	239
	Three corollaries · Weaker theories cannot prove the consistency of PA · PA cannot prove the consistency of stronger theories · Introducing Gentzen · What do we learn from Gentzen’s proof?	
33	Generalizing the Second Theorem	245
	More notation · The Hilbert-Bernays-Löb derivability conditions · T ’s ignorance about what it can’t prove · The Formalized Second Theorem · Jeroslow’s Lemma and the Second Theorem	
34	Löb’s Theorem and other matters	252
	Theories that ‘prove’ their own inconsistency · The equivalence of fixed points for $\neg Prov$ · Consistency extensions · Henkin’s Problem and Löb’s Theorem · Löb’s Theorem and the Second Theorem	
35	Deriving the derivability conditions	258
	The second derivability condition for PA · The third derivability condition for PA · Generalizing to nice* theories · The Second Theorem for weaker arithmetics	
36	‘The best and most general version’	262
	There are provable consistency sentences · The ‘intensionality’ of the Second Theorem · Reflection · The best version? · Another route to accepting a Gödel sentence?	

	Contents
37 Interlude: The Second Theorem, Hilbert, minds and machines	272
‘Real’ vs. ‘ideal’ mathematics · A quick aside: Gödel’s caution · Relating the real and the ideal · Proving real-soundness? · The impact of Gödel · Minds and computers · The rest of this book: another road-map	
38 μ -Recursive functions	285
Minimization and μ -recursive functions · Another definition of μ -recursiveness · The Ackermann–Péter function · Ackermann–Péter is μ -recursive but not p.r. · Introducing Church’s Thesis · Why can’t we diagonalize out? · Using Church’s Thesis	
39 Q is recursively adequate	297
Capturing a function defined by minimization · The recursive adequacy theorem · Sufficiently strong theories again · Nice theories can <i>only</i> capture μ -recursive functions	
40 Undecidability and incompleteness	300
Some more definitions · Q and PA are undecidable · The <i>Entscheidungsproblem</i> · Incompleteness theorems for nice’ theories · Negation-complete theories are recursively decidable · Recursively adequate theories are not recursively decidable · Incompleteness again · True Basic Arithmetic is not r.e.	
41 Turing machines	310
The basic conception · Turing computation defined more carefully · Some simple examples · ‘Turing machines’ and their ‘states’	
42 Turing machines and recursiveness	321
μ -Recursiveness entails Turing computability · μ -Recursiveness entails Turing computability: the details · Turing computability entails μ -recursiveness · Generalizing	
43 Halting and incompleteness	328
Two simple results about Turing programs · The halting problem · The <i>Entscheidungsproblem</i> again · The halting problem and incompleteness · Another incompleteness argument · Kleene’s Normal Form Theorem · A note on partial computable functions · Kleene’s Theorem entails Gödel’s First Theorem	
44 The Church–Turing Thesis	338
Putting things together · From Euclid to Hilbert · 1936 and all that · What the Church–Turing Thesis is and is not · The status of the Thesis	
45 Proving the Thesis?	348
	xi

Contents

Vagueness and the idea of computability · Formal proofs and informal demonstrations · Squeezing arguments – the very idea · Kreisel’s squeezing argument · The first premiss for a squeezing argument · The other premisses, thanks to Kolmogorov and Uspenskii · The squeezing argument defended · To summarize
