## Elastic Language

Elastic language carries non-specific and stretchable meaning, as in ‘He loves her, kind of’. It is used like a slingshot, targeting various strategic goals. Consolidating current research and charting new directions, this book develops a refreshing theory of elasticity, empirically attested by natural language data from tension-prone encounters between Australian Customs officers and passengers. The theory proposes three principles (fluidity, stretchability and strategy) and offers a systematic look at how elastic language, as a sliding scale, works to balance strengthening and weakening speech tones, to firm and soften a speaker’s stance, and to reveal and evade the truth. The comparative analysis of forms, functions and context confirms that elastic language is fluid, stretchable and strategic. It serves both cooperative and competitive functions, and social and speech factors impact on its use. This book will appeal to students and researchers working in pragmatics, applied linguistics, sociolinguistics, discourse analysis, and communication.

- Proposes a new conceptual framework for vague language and hedging.
- Uses stimulating data from interesting situations to support arguments.
- Presents mixed methods research for data analysis, which will appeal to both quantitative and qualitative researchers.

DR GRACE Q. ZHANG is an Associate Professor at Curtin University, Australia. She was awarded a PhD in linguistics by the University of Edinburgh in 1996, and has published extensively on elastic/vague language.

## Preface

---

More than three decades ago, when I began my Masters study in China, I little knew that I was embarking on a research journey that would last for thirty years and more. During the search for my Masters topic, I happened to read an article written by the late Professor Wu Tieping, the founder of fuzzy linguistics in China. The article introduced into linguistic study the fuzzy set theory developed by Lotfi A. Zadeh in 1965. The refreshing ideas inspired me to start researching vague language, and my thesis discussed vague meanings in Mandarin Chinese. The topic was so fascinating that my PhD also focused on the semantics of vague quantifiers. Since then my interest has not waned: vague language is full of uncharted territories, and my extensive publications offer a map for the first ventures into this field.

The study of vague language as an area of enquiry is non-conventional and somewhat peripheral to traditional linguistic studies. There exists negativity towards the concept of vague language. John Sinclair mentioned in his Forward to Joanna Channell's 1994 book *Vague Language* that the title worried the series editors initially, as they were unsure if the intended readership would accept it (p. xviii). Sinclair explained that vagueness has negative connotations and teachers would normally not endorse vagueness as part of the repertoire of communication. However, they decided to use the title because, as Sinclair says, there is nothing shameful in mentioning vagueness, and our language allows us to avoid precision and committal: without vagueness our communication would be severely inadequate. In the introduction to her 2007 work on vague language, Joan Cutting mentioned that her colleagues used vague language to humour her, for example ending an email to her with 'see you whenever it is, if not before'. There is still some way to go before we fully appreciate the nature of vague language.

My long but fruitful 'vague' journey has been challenging and fascinating, and thoroughly enjoyable. I work hard to justify the legitimacy of my work by convincing people that vague language is an integral part of our language. The ability to use vague language is as important as, if not more important than, the ability to use other types of language (e.g. precise language). To put

## xiv Preface

vague language on the linguistic map, and ensure it is understood and valued as it deserves, I continue to work, and to refine the topic. For instance, in this book the negative ‘vague language’ has been replaced with ‘elastic language’ to emphasise the real nature of this type of language and to resite it as a positive form. I hope this book is a small step towards staking a claim for the status of elastic language in linguistic studies.

Why and how do we stretch our words? This book attempts to answer the question by developing an elasticity theory to explain how stretching works, something lacking in the existing literature. Grounded in naturally occurring data in institutional (Australian Customs) settings, the book provides an account of the nature and function of elastic language. Participants in the data stretch language to negotiate and construct meanings, balance strengthening and weakening speech tones, firm and soften their stance, and adopt socially mandated roles in responding to a type of situation and their expected function in that situation. As a valuable resource, this book will be useful to students and researchers engaged in pragmatics, applied linguistics, sociolinguistics, discourse analysis, and communication.

## Acknowledgements

---

I am immensely indebted to the anonymous reviewers and the final clearance reader for the insightful feedback that has been incorporated into this book. I am also extremely grateful for Cambridge University Press editor Helen Barton's encouragement and support; she was always ready to help, an absolute pleasure to work with. The invaluable help provided by Glennis Starling, Bethany Gaunt, Gaia Poggiogalli, Sherleena Sandou, and other staff members of Cambridge University Press in the copy-editing process and production is also greatly appreciated. A big thank you also goes to Margaret Johnson, Xiaodan Zhang, Anne Guan, Peyman Sabet, Samantha Hornsby, Karen Wittcomb, Peter Robinson, and the transcribers of *Way With Words*, for their magnificent assistance in various stages of this project.

Writing this book needed time; I cannot thank enough for the wonderful and much needed support from Lina Pelliccione, my Head of School at Curtin University. I also appreciate the help given by my colleagues.

Without the kind permission of the Australian Customs and Border Protection Service in Sydney, this project would not have been possible, and I am very grateful for their generosity. I would also like to acknowledge, with gratitude, research grants awarded by Curtin University (AAPI and Humanities) that facilitated the production of the manuscript for this book. Thanks are due to Kristopher J. Preacher for his generous help with statistical calculations and his convenient online tool *Calculation for the chi-square test* (2010–2015), and to Mike Scott for his analysis software *WordSmith* (version 6.0, 2008). To any whom I may have failed to mention, I extend my gratitude.

Finally, I thank my loving parents Shimin Zhang and Lanyin Zhang, who have my eternal gratitude, and my husband Zhigang Guan and daughter Anne Guan, for bearing with me while I wrote this book. Without their unconditional love and unwavering support, this project would not have been completed, and I am grateful to them from the bottom of my heart.
