 Hartree–Fock approximation, 11
 paramagnetic susceptibility of some transition
 metals around 293 K, 11
 Zeeman splitting, 11
- passive drug targeting, magnetic drug delivery,
 112–15
- Pauli exclusion principle, atomic magnetic
 moments, 4–5
- peptides, magnetic drug delivery, 118–20
- PET, *see* positron emission tomography
- photoelectron emission microscopy (PEEM),
 structural analysis, 45
- photolithography
 alternative directions, 78–79
 electrochemical deposition, 76–78
 gold-coated particles, 76–78
- plasmon nano-optical tweezers, 109–10
 localized surface plasmon (LSP), 109–10
 surface plasmon polariton (SPP), 109–10
- plasmonic micro-trapping, tweezers, 111
- polar magneto-aerotaxis, magnetosomes,
 258–60
- polymer matrices, MNPs synthesis, 58
- positron emission tomography (PET)
 biocompatibility of MNCs for use in vivo, 117
 magnetic drug delivery, 117
- productivity (yield), MNPs synthesis, 63
- proteins applications, magnetosomes, 268–69
- quantification, 85–88
 alcohols tests, 87–88
 Fehling's test (for aldehydes), 87
 Kaiser test (for primary amines), 86–87
 MNPs functionalization, 85–88
 Ninhydrin test (for primary amines), 86–87
 spectrophotometry, 87
- quantum mechanical concepts, 2–3
- quantum mechanical wavefunction of two identical
 fermions, 4–5
- quenching of the orbital angular momentum, atomic
 magnetic moments, 5–6
- Rayleigh particle, gradient force, 91–92
- relaxivity of MNPs, MR, *see* MR relaxivity
 of MNPs
- research future directions, 270–71
- reverse microemulsions, MNPs synthesis, 57–58
- RNA transcription, optical tweezers, 93
- rocks/meteorites magnetic poles determination,
 magnetotactic bacteria, 267
- rotating nanowires
 electric tweezers, 98–103
 magnetic tweezers, 94–96
- Ruderman–Kittel–Kasuya–Yosida (RKKY) model,
 ferromagnetism, 15
- Russell–Saunders coupling, atomic magnetic
 moments, 4
- SAMs, *see* self-assembled monolayers
- SAW (standing acoustic wave) based acoustic
 tweezers, 108–9
- Schrödinger equation, 2–3
- self-assembled monolayers (SAMs)
 amines, 72
 biotin, 73
 carbodiimides, 72
 carboxylic acids, 72
 chain, 71
 chemical suppliers, 76
 gold-coated particles, 68–75
 head groups, 71–73
 hydroxyls, 71
 mixed SAMs, 73–75
 NHS esters, 73
 SAM monomers, 70–73
 tail groups, 70–71

- self-induced back-action (SIBA) trapping, tweezers, 111–12
- sensor noise, detectivity limits, 201–4
- shot noise
- detectivity limits, 202–3
 - magnetoresistive (MR) sensors, 202–3
- SIBA (self-induced back-action) trapping, tweezers, 111–12
- silicon-based bio-Hall sensors, 179
- single photon emission computed tomography (SPECT)
- biocompatibility of MNCs for use in vivo, 117
 - magnetic drug delivery, 117
- solid lipid nanoparticles, MNPs synthesis, 59–60
- solid routes, MNPs synthesis, 62
- spacer molecules
- epoxides, 84
 - MNPs functionalization, 84
- specific heat, magnetic measurements, 37
- SPECT, *see* single photon emission computed tomography
- spectrophotometry
- Beer's law, 87
 - quantification, 87
- spin density fluctuations close to T_c , thermal variation, magnetic measurements, 37–40
- spin valves (SV)
- detectivity limits, 204
 - giant magnetoresistance (GMR), 187–88
- spontaneous magnetization
- Bloch $T_{3/2}$ law, 31–32
 - magnetic measurements, 31–32
 - temperature dependence of magnetization, 31–32
- SPP (surface plasmon polariton), plasmon nano-optical tweezers, 109–10
- standing acoustic wave (SAW) based acoustic tweezers, 108–9
- Stern–Gerlach type experiment, magnetization of nanoparticles, 28
- Stöber method, MNPs synthesis, 60
- Stoner criterion, ferromagnetism, 14–15
- Stoner–Wohlfarth model, magnetoresistive sensor linearization, 194
- structural analysis, 45–46
- Fullprof profile refinement program, 46
 - photoelectron emission microscopy (PEEM), 45
 - transmission electron microscopy (TEM), 45
- studies, magnetic drug targeting, 127–28, 134
- SU8 epoxy resin, 79
- gold/SU8 microcarrier, 88
- superconducting quantum interference device (SQUID), magnetometers, 30–31
- superparamagnetic relaxation magnetization of nanoparticles, 30
- Mössbauer spectroscopy, 41–42
- superparamagnetism, 30, 115
- bead array counter concept, 207
 - superparamagnetic beads (SPBs), 179, 195–96, 219–20
 - superparamagnetic behavior, 194–95
 - superparamagnetic labels, 207–8
 - superparamagnetic nanoparticles, 234–36
- surface coating, MNCs, *see* gold-coated particles
- biocompatibility of MNCs for use in vivo, 117–18
 - magnetic drug delivery, 117–18
- surface plasmon polariton (SPP), plasmon nano-optical tweezers, 109–10
- SV, *see* spin valves
- synthesis of MNPs, 52–63, 115–16
