

## Index

- activation probability, 470
- adaptive filter, 284
- adaptive subgradient method, 283
- admissibility, 295
- admission control, 296
- aggregate excess demand, 92
- Arrow–Debreu market, 76
- auction theory, 437
- auctions, 3, 465
- bandwidth allocation, 333
- Bayes–Nash equilibrium, 32, 34, 39
- Bayesian equilibrium, 204
- Bayesian incentive compatibility, 117, 134
- Bayesian monotonicity, 117
- Bayesian Nash equilibrium (BNE), 112
- best response dynamics, 37, 211, 541
- binary hypothesis testing, 265
- bordered Hessian determinant, 81
- budget balance, 114
- budget balanced, 3
- budget set, 76
- capacity scaling, 313
- CDMA synchronization, 520, 532
- channel models, 150
- channel probing, 294
- Chebyshev polynomials, 274
- coalitional game, 230–232, 238, 248
- coarse correlated equilibrium, 200
- Coase Theorem, 554, 557, 559, 560
- cognitive radio, 307
- collusion, 571, 572
- CoMAC, 279
- competitive market, 76
- conflict graph, 469
- consensus, 268
- context-aware resource allocation, 385
- contract curve, 96
- convex function, 264
- convex set, 264
- demand function, 77
- direct revelation mechanism, 113
- dominant strategy equilibrium, 111
- dominant strategy implementation, 4
- double auction mechanism, 453
- Edgeworth box, 96
- efficient rationing, 558, 559
- endowment, 76
- energy efficiency, 4, 519, 535
- environment, 110
- equilibrium concept, 111
- Erlang Fixed Point Approximation (EFPA), 500
- evolutionary game theory, 156
- ex-post generalized Nash equilibrium, 538
- ex-post Nash equilibrium, 529
- expenditure function, 78
- Federal Communications Commission (FCC), 552–554, 564, 570–575
- femtocell networks, 376
- first-price auction, 467
- fractional demand, 470
- game form, 109, 110
- games with strict incomplete information, 528
- general equilibrium, 92
- general interference functions, 5
- generalized fading distributions, 317
- generalized Nash games, 536
- goal correspondence, 110
- gossip consensus, 271
- greedy algorithm, 465
- gross substitute property, 94
- Hicksian demand function, 79
- hierarchical package bidding (HPB), 570, 572, 573
- hierarchical spectrum auctions, 447
- homogeneous of degree zero, 83
- implementation in Bayesian Nash equilibrium, 113, 117
- implementation in dominant strategies, 112, 115
- implementation in Nash equilibrium, 112, 116
- implementation theory, 109, 110
- incomplete network information, 399
- indifference curve, 83
- indirect utility function, 78

- individual rationality, 114
- interaction mechanisms, 412
- interference, 469, 496
- interference channel (IFC), 85
- interference games, 32, 33, 35, 36, 38, 39, 41, 44
- interference-based coupled user utility, 3
- irreducible matrix, 265
- Karush–Kuhn–Tucker (KKT) conditions, 77
- Kelly mechanism, 4
- Laplacian matrix, 270
- learning Nash equilibria, 211
- linear interference functions, 10
- log-convex interference functions, 5
- Markov process, 500
- mass-action interpretation of Nash equilibrium, 118, 129
- matrix  $p$ -norm, 264
- maximum ratio transmission (MRT), 86
- mean-field equilibrium, 69
- mean-field games, 59, 64
- mean-field optimal control, 65
- mechanism, 109, 110
- mechanism designer, 3
- message space, 109, 110
- metric projection, 264
- Metropolis–Hastings, 269
- mobility model, 62
- monotonicity, 116
- multi-carrier (MC), 89
- multi-carrier systems, 3, 5
- multi-stage bargaining game, 403
- multiple object auctions, 441
- multiple-input single-output (MISO), 85
- Myerson–Satterthwaite Theorem, 553, 554, 560, 562, 563
- Nash equilibrium, 36
- Nash equilibrium (NE), 4, 36, 112, 521
- Nash equilibrium, generalized, 197
- Nash implementation, 4
- near-far effect, 521
- network mechanism design, 4
- Neyman–Pearson criterion, 266
- nomographic functions, 282
- online learning, 145
- operator norm, 264
- orthogonal frequency division multiplexing, 352
- orthogonal frequency division multiplexing (OFDM), 10
- outcome function, 109, 110
- outcome space, 110
- Pareto optimality, 95
- partition form, 231, 232, 238
- power allocation, 118, 121, 122, 125, 127, 132, 140
- power control, 524
- price anticipating users, 4
- price of anarchy, 3
- pricing (Pigovian) mechanisms, 10
- pricing spectrum lease, 502
- primitive matrix, 265
- private commons, 506
- quality of service (QoS), 80
- quasi-concave, 77
- random rationing, 558
- randomized learning, 160
- reducible matrix, 265
- regression learning, 3
- regret, 146
- regularity condition, 137
- repeated games, 45–47
- reservation utility, 111, 114
- reservation-based admission policies, 508
- reserve price, 486
- resource allocation, 3
- revelation principle, 113, 542
- revenue maximization, 132, 135
- robust equilibrium, 202
- sequential equilibrium, 34, 43, 47
- sequential games, 32, 34, 41, 50
- sequential games with entry, 34, 44, 51
- set-theoretic adaptive filter, 285
- Shannon capacity, 36
- signal propagation, 466
- signal-to-interference-and-noise-ratio (SINR), 80
- signal-to-interference-plus-noise ratio (SINR), 5
- simulated annealing, 514
- simultaneous games, 32, 33, 35
- simultaneous multiple round auction (SMR), 572–574
- social choice correspondence, 110, 111
- social choice rule, 110, 111
- social welfare maximizing correspondence, 122
- spectral mask constraint, 90
- spectrum access, 233, 465
- spectrum auction, 467
- spectrum leasing, 502
- spectrum license, 574, 575
- spectrum sensing, 229, 230, 232–234, 236–242
- spectrum sharing, 118, 121, 122, 127, 132, 133
- standard interference functions, 5
- strategy space, 109–111
- strategy-proof, 3, 465
- strategy-proof scalar mechanisms, 6

- 
- subband allocation, 379
  - subdifferential, 264
  - subgradient, 264
  - substitution matrix, 79
  - supermodular games, 38
  - tatonnement process, 94
  - truthful implementation, 113
  - universal pricing, 15
  - utility, 111
  - utility function, 77
  - utility maximization problem, 77
  - Vickrey–Clarke–Groves (VCG) mechanism,  
4, 554, 561, 562, 564–566, 568, 570–572
  - voluntary participation, 135
  - Walras’ law, 93
  - Walrasian equilibrium, 92
  - Walrasian market model, 92
  - Walrasian prices, 92
  - waterfilling, 90
  - weak no-veto power, 116
  - weak Pareto correspondence, 122
  - white space, 352
  - WiMAX, 80
  - wireless spectrum, 464
  - zero forcing (ZF), 86
