Nomenclature *page* xiii
Main xiii
Greek letters xix
Subscripts xxi
Abbreviations xxii
Industrial crystallization in practice: from process to product xxiii
Scope of the book xxiii
Summary of the chapters xxv
Chapter 1: Thermodynamics, crystallization methods and supersaturation xxv
Chapter 2: Characterization of a crystalline product xxv
Chapter 3: Basic process design for crystallization xxv
Chapter 4: Nucleation xxv
Chapter 5: Crystal growth xxvi
Chapter 6: Agglomeration xxvi
Chapter 7: The population balance equation xxvi
Chapter 8: Batch crystallization xxvi
Chapter 9: Measurement techniques xxvii
Chapter 10: Industrial crystallizers xxvii
Chapter 11: Precipitation and anti-solvent crystallization xxvii
Chapter 12: Melt crystallization xxvii
Chapter 13: Additives and impurities xxviii
Chapter 14: Polymorphism xxviii
References xxviii

1 Thermodynamics, crystallization methods and supersaturation 1

1.1 Why this chapter is important 1
1.2 Phase diagrams 1
1.3 Crystallization methods 4
1.3.1 Modes of operation 4
1.3.2 Crystallization from the melt 6
1.3.3 Crystallization from solution 6
1.4 Selection of crystallization methods 11
1.5 Supersaturation 14
1.5.1 General thermodynamic expression for the supersaturation 14

Alison Lewis , Marcelo Seckler , Herman Kramer , Gerda van Rosmalen
Table of Contents
More Information

1.5.2 Supersaturation for processes at constant temperature and pressure 15
1.5.3 Driving force for processes at constant pressure (varying temperature) 17
1.5.4 Driving force for processes at constant temperature (varying pressure) 17
1.5.5 Practical expressions for the supersaturation 17
1.6 Thermodynamic models and speciation 19
1.6.1 Activity models for organics 20
1.6.2 Activity models for electrolytes 21
1.6.3 Selection of a thermodynamic model 21
1.7 A brief summary of the chapter 22
1.8 End of chapter problems 23
1.9 References 24

2 Characterization of a crystalline product 26

2.1 Why this chapter is important 26
2.2 Crystal size distribution (CSD) or particle size distribution (PSD) 26
2.2.1 Definitions of crystal size L 27
2.2.2 Representations of the CSD 28
2.3 Crystal shape 35
2.3.1 Quantifying crystal shape 36
2.3.2 Predicting crystal morphology and shape 37
2.3.3 Effect of operating conditions on crystal shape 40
2.4 Polymorphism 42
2.5 Mother liquor inclusions 44
2.6 Uptake of impurities in the crystal lattice 47
2.7 Degree of agglomeration 48
2.8 A brief summary of the chapter 48
2.9 End of chapter problems 49
2.10 References 50

3 Basic process design for crystallization 51

3.1 Why this chapter is important 51
3.2 The basic design procedure 51
3.2.1 Design Level 0: initial design specifications 52
3.2.2 Design Level I: crystalline product design 52
3.2.3 Design Level II: physicohemical design of the crystallization task 53
3.2.4 Design Level III: flow-sheet design of the crystallization process 55
3.2.5 Design Level IV: crystallizer design 60
3.2.6 Economic evaluation of the design 64
3.3 Worked examples 65
3.3.1 A continuous evaporative crystallizer 65
3.3.2 A continuous cooling crystallizer 67

Table of Contents
More Information

3.4 A brief summary of the chapter 68
3.5 End of chapter problems 69
3.6 References 69

4 Nucleation 71

4.1 Why this chapter is important 71
4.2 Primary nucleation 71
4.2.1 Homogeneous primary nucleation 71
4.2.2 Heterogeneous primary nucleation 77
4.3 Nucleation theorem 78
4.3.1 Induction time and metastable zone 78
4.3.2 Measurement of nucleation rate 80
4.4 Non-classical nucleation 82
4.4.1 Two-step nucleation with an intermediate liquid 83
4.4.2 Two-step nucleation with an intermediate solid 86
4.5 Secondary nucleation 89
4.5.1 Secondary nucleation mechanisms 89
4.5.2 Secondary nucleation: the power law 91
4.5.3 Secondary nucleation: taking into account collision mechanisms 92
4.5.4 Secondary nucleation: the attrition behavior of parent crystals 93
4.5.5 Secondary nucleation: a physical attrition model 96
4.6 A brief summary of the chapter 100
4.7 End of chapter problems 101
4.8 References 102

5 Crystal growth 104

5.1 Why this chapter is important 104
5.2 Basic concepts 104
5.3 Crystal growth mechanisms 105
5.4 Crystal surfaces 106
5.5 Surface integration-controlled growth 107
5.5.1 Smooth growth 107
5.5.2 Rough growth 112
5.5.3 Thermal and kinetic roughening 113
5.6 Volume diffusion-controlled growth 115
5.7 Combined volume diffusion- and surface integration-controlled growth 117
5.8 Effect of temperature 118
5.9 Heat transfer-controlled growth 119
5.10 Simultaneous mass and heat transfer 120
5.11 Growth rate dispersion 120
5.12 Enhanced growth rate of crystals by addition of macro-building blocks 123
5.13 Dissolution of crystals 123

More Information

5.14 Measuring the growth rate 124
5.14.1 Direct measurement of the linear growth rate of individual crystals 124
5.14.2 Indirect measurement of the growth rate of populations of crystals via mass deposition rates 125
5.15 A brief summary of the chapter 126
5.16 End of chapter problems 126
5.17 References 128

6 Agglomeration 130

6.1 Why this chapter is important 130
6.2 Agglomeration or aggregation? 130
6.3 The agglomeration process 132
6.3.1 Transport and collision of particles 133
6.3.2 Particle–particle interactions 140
6.3.3 Collision efficiency and disruption of aggregates 141
6.3.4 Aggregate cementation 142
6.4 Modeling agglomeration: the agglomeration kernel 142
6.5 Determination of the agglomeration kernel from experimental data 144
6.5.1 Case study 1: calcium oxalate monohydrate (Bramley *et al.*, 1997) 145
6.5.2 Case study 2: $Al(OH)_3$ (Van Leeuwen, 1998) 146
6.6 A brief summary of the chapter 147
6.7 End of chapter problems 147
6.8 References 148

7 The population balance equation 151

7.1 Why this chapter is important 151
7.2 Evolution of the crystal size distribution in a crystallizer 151
7.3 The population balance equation 153
7.3.1 Formulation of the population balance 153
7.3.2 The population balance for agglomeration and breakage 156
7.3.3 Relationship between the population balance and mass and heat balances 158
7.4 Solving the population balance for an ideally mixed one-compartment model 159
7.4.1 Population balance equation for stationary operation 159
7.4.2 Moment equations for stationary and non-stationary operation 164
7.4.3 Moment equations in case of agglomeration and breakage 166
7.4.4 Numerical solutions of the PBE 167
7.5 Modeling and scaling-up of crystallizers 168
7.6 A brief summary of the chapter 172
7.7 End of chapter problems 174
7.8 References 176

8 Batch crystallization 178

8.1 Why this chapter is important 178
8.2 Phenomenological description of batch crystallization processes 178
8.3 Seeding procedure 181
8.3.1 Seed load and seed size 181
8.3.2 The timing of seed addition 184
8.3.3 Generation of seeds and their quality 184
8.4 Mathematical modeling 185
8.5 Cooling and evaporation trajectories 186
8.5.1 Natural and linear cooling 186
8.5.2 Constant supersaturation 187
8.6 Optimal trajectories 187
8.7 A brief summary of the chapter 189
8.8 End of chapter problems 189
8.9 References 190

9 Measuring techniques 192

9.1 Why this chapter is important 192
9.2 Sampling and dilution procedures 192
9.3 PSD measuring techniques 193
9.3.1 Sieve analysis 193
9.3.2 Coulter counter 194
9.3.3 Dynamic light scattering 194
9.3.4 Forward light scattering 195
9.3.5 Ultrasonic attenuation 196
9.3.6 Backward light scattering 197
9.3.7 Imaging 197
9.4 Supersaturation measuring techniques 200
9.4.1 Refractive index 200
9.4.2 ATR-FTIR spectroscopy 201
9.4.3 Density 202
9.5 Other techniques 204
9.6 Selection of measuring technique 204
9.7 A brief summary of the chapter 206
9.8 End of chapter problems 206
9.9 References 207

10 Industrial crystallizers 210

10.1 Why this chapter is important 210
10.2 Criteria for the choice of a crystallizer 210
10.3 Solar ponds 212
10.4 Thermo-syphon crystallizer 213

10.5 Stirred draft tube crystallizer 215
10.5.1 Clear liquor advance 219
10.6 Forced circulation crystallizer 220
10.7 Fluidized bed crystallizer 225
10.8 Growth crystallizer 227
10.9 Spray evaporative crystallizer 228
10.10 Direct cooling crystallizer 228
10.11 Surface cooling crystallizer 229
10.12 Cascades of crystallizers 231
10.13 References 232

11 Precipitation and anti-solvent crystallization 234

11.1 Why this chapter is important 234
11.2 What is precipitation? 234
11.3 What makes it unique? 234
11.4 Characteristics of precipitation processes 236
11.4.1 Dominant phenomena in precipitation 236
11.5 Mixing in precipitation processes 237
11.5.1 Macro-mixing 238
11.5.2 Meso-mixing 238
11.5.3 Micro-mixing 239
11.6 Time and length scales for mixing and precipitation 240
11.7 Scale-up 242
11.7.1 Simplified compartmental modeling approach 243
11.7.2 Scale-up using an experimental approach: the three-zone model 245
11.7.3 Scale-up using numerical modeling 246
11.7.4 Eulerian modeling approach 246
11.7.5 Lagrangian modeling approach 249
11.8 A practical approach: mixing configurations in stirred vessels 251
11.9 Anti-solvent crystallization 255
11.10 A brief summary of the chapter 256
11.11 End of chapter problems 257
11.12 References 258

12 Melt crystallization 261

12.1 Why this chapter is important 261
12.2 Definitions of melt crystallization 261
12.3 Advantages/disadvantages 262
12.4 Thermodynamics 263
12.4.1 Phase diagrams 263
12.4.2 Impurity distribution 263
12.5 Melt crystallization techniques 265

More Information

12.5.1 Solid layer melt crystallization 265
12.5.2 Suspension melt crystallization 269
12.6 Eutectic freeze crystallization 274
12.6.1 Binary phase diagrams 275
12.6.2 Ternary phase diagrams: Na_2SO_4–$MgSO_4$–H_2O 277
12.7 A brief summary of the chapter 280
12.8 End of chapter problems 280
12.9 References 281

13 Additives and impurities 284

13.1 Why this chapter is important 284
13.2 Application and occurrence 284
13.3 Mechanism of organic growth inhibitors 285
13.3.1 Small organic molecules 285
13.3.2 Large organic molecules 285
13.4 Tailor-made additives 287
13.4.1 Small organic tailor-made additives 287
13.4.2 Application of tailor-made additives 288
13.4.3 Molecular modeling 288
13.4.4 Application of molecular modeling to the design of an anti-malarial drug 290
13.5 Small unintentionally present organic molecules and solvents 291
13.6 Tailored polyelectrolytes 293
13.6.1 Polyelectrolytes for organic crystals 293
13.6.2 Polyelectrolytes for mineral crystals 294
13.6.3 Proteins for ice crystals 296
13.7 Metal ions 296
13.8 Small anions 298
13.9 Additives as templates for controlled nucleation 299
13.10 A brief summary of the chapter 300
13.11 References 300

14 Polymorphism 303

14.1 Why this chapter is important 303
14.2 Occurrence and consequences 303
14.3 Types of polymorphs 307
14.3.1 Monotropic system 307
14.3.2 Enantiotropic system 308
14.4 Kinetics of polymorph formation 309
14.4.1 Metastable zone width 309
14.4.2 Seeding 311
14.4.3 Templates 311
14.4.4 Molecular structure of the solvent 312
