<i>Preface</i>	<i>page</i> vii
<i>Acknowledgments</i>	viii
1 The basic ideas of thermodynamics and statistical mechanics	1
1.1 From atoms to thermodynamics	1
1.2 Counting quantum states	5
1.3 Equilibrium, equal probabilities and temperature	14
1.4 The way entropy works	17
1.5 Some difficulties and their resolutions	21
2 The care and feeding of thermodynamic variables	28
2.1 The thermodynamic variables	28
2.2 Partial derivatives	29
2.3 Some special partial derivatives	33
2.4 Thermodynamic operations	37
3 Gases and other matters	45
3.1 The states of matter	45
3.2 Ideal and non-ideal gases	59
3.3 The atmosphere	66
4 The laws of thermodynamics	69
4.1 The origin and meaning of the first and second laws	69
4.2 Ideal engines	73
4.3 Tools of the trade	81
5 The Boltzmann factor and the partition function	91
5.1 The Boltzmann factor	91
5.2 What happened?	96

Cambridge University Press

978-1-107-08011-9 - Thermal Physics: Energy and Entropy

*Contents*

5.3	The density of states	97
5.4	Energy and entropy	100
5.5	The entropy of an ideal gas	105
6	Thermodynamic functions	108
6.1	Free energies	108
6.2	The chemical potential	113
6.3	Variational properties	116
6.4	Phase equilibrium in systems of more than one constituent	117
7	Statistical mechanics for fixed and variable $N$	119
7.1	Statistical mechanics for fixed $N$	119
7.2	The Gibbs distribution and the partition function	121
7.3	Statistical mechanics for variable $N$	124
8	More advanced topics	127
8.1	Interacting particles	127
8.2	Doing sums as integrals	128
8.3	The partition function for interacting particles	130
8.4	What happened?	131
8.5	The statistical mechanics of real molecules	133
8.6	Two atoms	133
8.7	More atoms	135
8.8	More about equations of state	139
8.9	The van der Waals equation of state	143
	<i>Solutions to the problems</i>	147
	<i>Index</i>	164
