Index

radiolysis products (cont.)
  homogeneous formation, 150
  hydrated electron, 147, 154, 158–59
  hydrogen, 154–56
  hydrogen ions, 157
  initial yield, 147
  oxygen, 155, 157
  reaction-diffusion equation, 148
  recombination, 149
  steady state concentration, 150, 152
resolution
  cryoelectron microscopy, 477
  overview, 10
  SEM, 11, 83–85, 121
  STEM, 174–77
  TEM, 165–74
  temporal, 456–62
  rotavirus, 362–66
  attachment to membrane, 363
  imaging mRNA transcripts, 363
  internal structure, 365–66

sample design
  for battery reactions in open cell TEM, 58, 63
  for battery reactions in SEM, 73
  for live cell imaging, 344–45
  for WetSTEM, 62, 337
  for whole biological cells, 336–37, 340
  for liquid droplets in SEM, 57
  for sample passivation with ionic liquids, 62
  for thin foil, 267, 429
sample holder design
  control by potentiostat, 217–18, 239, 263
  examples, 43–44
  for anodic etching, 211–12
  for fluid mixing, 319–21
  for gas diffusion, 325
  for magnetization experiments, 487
  for open cell battery reactions, 63–70
  for XEDS, 422, 425
  glove box loading, 65, 229
  historical context, 6, 8
  laser heating, 130, 462
  liquid injection via glass capillary microelectrode, 380–81
  resistance furnace, 129
  temperature-controlled electrochemistry, 136
  thermoelectric device, 130
silicon nitride
  etching, 307–8
  for liquid phase FEBIP, 295–96
  materials properties, 39
  window fabrication, 39–41
  with patterned electrodes, 213–16
  solder, 115
  solid electrolyte interphase, 238, 244
  dendritic growth, 245
formation, 245
solubility
  effect of pressure, 155
  of gases in water, 131, 154
spatial resolution in S/TEM
  aberration-corrected S/TEM, 434–53
  accelerating voltage, 487
  and sample thickness, 10, 166, 168, 450
  beam broadening, 177
  chromatic aberration limited, 166, 446
  contrast transfer function, 435–38
  determining factors, 165, 173
  diffraction limited, 165
  dose limited, 170–73, 176
  energy filtering, 173
  of labels in closed cell STEM, 336–37, 341
  probe broadening, 174
  spherical aberration limited, 166, 435, 444
  thin liquid in microwells, 358–59
  top–bottom effect, 168, 423
spatial resolution in SEM
  beam broadening, 85
  effect of accelerating voltage, 85
  effect of windows, 80–85
  in AirSEM, 122
  interaction volume, 80, 121, 298, 411
  minimum SEM beam current, 84
  noise limited, 83
  probing depth, 81
  through 2D window materials, 92–97
spherical aberration correction
  delocalization, 437
  effect on contrast transfer function, 435
  for nanoparticle growth, 397
  higher order aberrations, 440
  negative Cs imaging, 438
  resolution improvement, 166, 173, 437
  STEM, 444–46
  TEM, 435–44
  steel, 421
  corrosion, 266, 430
temperature control, 127–38
  beam-induced heating, 131
  extreme conditions, 21
  for biological materials and processes, 489
  for nanoparticle growth, 199
  Joule heating, 128
  laser heating, 130
  Peltier heater, 130
  resistance furnace, 129
  thermal reservoir, 130
temperature measurement
  materials transformations, 132
  optical methods, 132
  resistance temperature detector, 129
  thermal diffusion models, 129
thermocouple, 130, 132
temporal resolution, 23, 177–79, 456–62
benefits, 177, 456–57, 466
dose fractionation, 178
dose-limited, 178
for biological processes, 368–69
motion blur, 11, 177, 458, 470
with pulsed electron source, 460
thin film growth physics
dendrite formation, 113, 226–27, 249–50
growth front stability, 226
SEI formation, 244
WetSTEM, 9, 62, 337
dose and damage, 342
examples, 62
of nanoparticle uptake, 348–49
resolution, 9
sample design, 337
whole biological cells, 18, 341–42
wetting, 16, 19, 278
ionic liquids, 58
of windows, 168, 268
void formation, 285
water, 62
whole biological cells, 334–51
bacteria, 415
comparison of imaging techniques, 335–37, 342
imaging strategies, 17, 334–37
lethal dose, 18, 173
live cells in closed cell STEM, 346
preparation of cells on chips, 107, 336, 340–41
viability testing, 346
window spacing and deflection, 35
calculation, 47–48
effect on resolution, 11, 326
electrochemical experiments, 229
graphene liquid cell, 394

liquid phase FEBIP, 295
measurement by EELS, 47, 182, 417
microwells, 358–59
partially filled liquid cell, 377
radiolytic gas, 156
thick liquid for biological imaging, 338
windows, 38–41
carbon, 375–76
design for holography, 485
effect on SEM image, 80–85
etched wells, 358–59
for liquid phase FEBIP, 294–97
graphene, 39, 93, 96
graphene coated onto sample, 10, 94
graphene oxide, 39, 95–96
hexagonal boron nitride, 39
materials properties, 38
microfabrication, 39–41
nitrocellulose, 5
polyimide, 39, 83, 86, 294
preparation of 2D materials, 95–96
silicon nitride, 39, 107, 295, 337
silicon nitride for SEM, 92–93
silicon oxide, 39
surface functionalization, 357–59
thickness and resolution, 168
to seal SEM column, 121
transmittance in SEM, 82

XEDS
composition of liquids, 428
in closed cell SEM, 92, 94, 97
liquid thickness, 423–24
materials in water, 427
principles, 409, 420
spectroscopic imaging, 409
through graphene, 97
X-ray absorption path length, 422

Zn electrodeposition, 225
