

Earth Materials

Introduction to Mineralogy and Petrology

This concise, accessible, market-leading textbook brings together the wide-ranging fundamentals students need to understand rocks and minerals, and shows them how they relate to the broader Earth, materials and environmental sciences. Designed specifically for one-semester courses, it is beautifully illustrated in full colour to explain the key concepts in mineralogy and petrology. This revision has been fully updated based on classroom experience. Including a completely new chapter providing an elementary introduction to thermodynamics, kinetics, radioactive decay and absolute dating, this new edition also features new mineral descriptions and many new stunning color photographs. A new section on hydraulic fracturing and discussion of some of its most serious potential environmental consequences has also been added. Stunning photos of mineral specimens and rock thin sections help students build a core understanding, whilst close intergration of clear illustrations with engaging text create a highly effective learning experience.

Cornelis (“Kase”) Klein was Professor in the Department of Earth and Planetary Sciences at the University of New Mexico, Albuquerque. He received his B.Sc. and M.Sc. in geology from McGill University, Canada, and his Ph.D. from Harvard University, also in geology. He was a member of the Geology faculty at Harvard University, Indiana University, Bloomington, and the University of New Mexico: he taught courses in mineralogy at all these universities. His published books include *Manual of Mineralogy* (19th–21st eds.); *Manual of Mineral Science* (22nd–23rd eds.); and *Minerals and Rocks: Exercises in Crystal and Mineral Chemistry, Crystallography, X-Ray Powder Diffraction, Mineral and Rock Identification, and Ore Mineralogy* (3rd ed., 2008). He received two awards for excellence in teaching from the University of New Mexico.

Anthony R. Philpotts is Emeritus Professor of Geology and Geophysics at the University of Connecticut, a Visiting Fellow in the Department of Geology and Geophysics at Yale University, and Adjunct Professor in the Department of Geosciences at the University of Massachusetts. He received his B.Sc. and M.Sc. in geology from McGill University, Canada, and his Ph.D. from the University of Cambridge. He has taught igneous and metamorphic petrology courses at McGill University and the University of Connecticut for more than 40 years. His published books include *Principles of Igneous and Metamorphic Petrology* (2nd ed., 2009, Cambridge University Press) and *Petrography of Igneous and Metamorphic Rocks* (1989, 2003).

Cornelis Klein dedicates this book to his two children and their immediate families. His son and daughter-in-law, Marc and Laura Klein, and their two children, Alexandra and Hugh. And to his daughter and son-in-law, Stephanie and Jack Stahl, and Stephanie's three sons, Max, Miles, and Bo Peponis.

Anthony R. Philpotts dedicates this book to his three daughters, Liane, Marlaine, and Alison.

Contents

Preface	xv	2.8 Plate Tectonics and the Generation of Rocks	30
Acknowledgments to First Edition	xviii	2.8.1 Midocean-ridge Rock Factory	30
Acknowledgments to Second Edition	xix	2.8.2 Convergent-plate-boundary Rock Factory	30
1		2.8.3 Continental Divergent-plate-boundary Rock Factory (Rift Valley)	32
Introduction	1	2.8.4 Mantle Plume Hot-spot Rock Factory	32
1.1 Formation of Earth's Chemical Elements in Supernovae	2	2.8.5 Passive-margin Rock Factories	32
1.2 Birth of the Solar System and Earth	2	2.8.6 Epeiric-sea Rock Factories	32
1.3 Accretion and Early History of the Earth	5	2.8.7 Metamorphic Rock Factories	33
1.4 Internal Structure of the Earth	5	Summary	33
1.5 Cooling of the Planet and Plate Tectonics	6	Review Questions	34
1.6 Plate Tectonics and the Formation of Rocks	7	Online Resources	35
1.6.1 Divergent Plate Boundaries	8	Further Reading	35
1.6.2 Convergent Plate Boundaries	9	3	
1.6.3 Transform Boundaries	9	How Are Minerals Identified?	37
1.6.4 Mantle Plumes and Hot Spots	9	3.1 Habit	38
1.7 Outline of Subsequent Chapters	9	3.2 State of Aggregation	39
Summary	10	3.3 Color and Luster	40
Review Questions	11	3.3.1 Reasons for Color	43
Online Resources	11	3.4 Cleavage	47
Further Reading	11	3.5 Hardness	49
2		3.6 Specific Gravity (Relative Density)	50
Materials of the Solid Earth	13	3.6.1 Specific Gravity and Atomic Structure	51
2.1 Definition of a Mineral	14	3.7 Magnetism, Solubility in Acid, and Radioactivity	51
2.1.1 Examples of Some Familiar Minerals	15	3.8 Instrumental Methods for the Quantitative Characterization of Minerals	52
2.2 How Are Minerals Classified?	18	3.8.1 X-Ray Powder Diffraction	53
2.3 How Are Minerals Named?	19	3.8.2 Electron Beam Techniques: Scanning Electron Microscopy, Electron Microprobe Analysis, and Transmission Electron Microscopy	54
2.4 What Is a Crystal, and What Is the Crystalline State?	20	Summary	58
2.5 What Is a Rock?	21	Review Questions	58
2.6 How Do Rocks Form? Classification into Igneous, Sedimentary, and Metamorphic	23	Further Reading	59
2.7 Examples of Some Familiar Rocks	25		

4**Fundamentals of Crystal Structures**

4.1	Naturally Occurring Chemical Elements	61
4.2	Atomic and Ionic Radii	62
4.3	What Factors Control the Packing of Ions (and Atoms) in Mineral Structures?	65
4.4	Pauling's Rules	66
4.5	What Forces Hold Crystal Structures Together?	73
4.5.1	Electronic Configuration of Atoms and Ions	74
4.5.2	Chemical Bonding	75
4.6	Atomic Substitutions	79
4.6.1	Factors Responsible for the Extent of Atomic Substitution (Solid Solution)	79
4.6.2	Types of Solid Solution	82
	Summary	82
	Review Questions	84
	Further Reading	85

5**Introduction to Crystallography**

5.1	Symmetry Elements and Operations	87
5.2	Combinations of Symmetry Elements	89
5.3	The Six Crystal Systems	91
5.3.1	Crystallographic Axes	91
5.3.2	Hermann–Mauguin Symmetry Notation	91
5.3.3	Crystallographic Notation for Planes in Crystals	93
5.3.4	Definition of Crystal Form	96
5.3.5	Crystallographic Notation for Directions in Crystals	98
5.4	Crystal Projections	98
5.5	Seven of the Thirty-two Point Groups	101
5.6	Twins	112
5.7	Some Aspects of Space Groups	115
5.7.1	Space Groups	119
5.8	Polymorphism	122
	Summary	131
	Review Questions	132
	Further Reading	133

6**Minerals and Rocks Observed under the Polarizing Optical Microscope**

6.1	Light and the Polarizing Microscope	135
6.2	Passage of Light through a Crystal: Refractive Index and Angle of Refraction	138

6.3	Passage of Polarized Light through Minerals	139
6.4	Accessory Plates and Determination of Fast and Slow Vibration Directions	143
6.5	Extinction Positions and the Sign of Elongation	144
6.6	Anomalous Interference Colors, Pleochroism, and Absorption	144
6.7	Mineral Identification Chart	145
6.8	Uniaxial Optical Indicatrix	146
6.9	Biaxial Optical Indicatrix	148
6.10	Uniaxial Interference Figures	149
6.11	Determination of Optic Sign from Uniaxial Optic Axis Figure	151
6.12	Biaxial Interference Figures, Optic Sign, and Optic Angle (2V)	151
6.13	Modal analysis	153
	Summary	154
	Review Questions	156
	Online Resources	157
	Further Reading	157

7**Igneous Rock-forming Minerals**

7.1	Common Chemical Elements in the Earth's Crust and in Mineral and Rock Analyses	159
7.2	Calculation of Mineral Formulas	160
7.3	Triangular Diagrams	163
7.4	Systematic Mineralogical Descriptions of Common Igneous Minerals	164
7.5	Plagioclase Feldspar	166
7.6	K-Feldspar	168
7.7	Quartz and Silica Polymorphs	169
7.8	Nepheline	170
7.9	Leucite	171
7.10	Sodalite	172
7.11	Enstatite	173
7.12	Pigeonite	173
7.13	Augite	175
7.14	Aegirine	176
7.15	Hornblende	177
7.16	Muscovite	178
7.17	Phlogopite	179
7.18	Biotite	180
7.19	Olivine	182
7.20	Zircon	182
7.21	Tourmaline	183
7.22	Allanite	184

7.23	Melilite	185	8.10	Rates of Geologic Processes	225
7.24	Magnetite	185	8.10.1	Transport Laws	226
7.25	Chromite	186	8.10.2	Rates of Activated Processes and the Arrhenius Relation	227
7.26	Hematite	187	8.11	Radioactive Decay	229
7.27	Ilmenite	187	8.11.1	Rate of Radioactive Decay	230
7.28	Rutile	189	8.11.2	Calculation of Absolute Age Based on Radioactive Decay	230
7.29	Uraninite	189	8.11.3	Absolute Dating by the ⁸⁷ Rb to ⁸⁷ Sr Decay	231
7.30	Pyrite	190	8.11.4	Absolute Dating by the ⁴⁰ K to ⁴⁰ Ar Decay	232
7.31	Pyrrhotite	191	8.11.5	Absolute Dating Using Uranium and Lead	233
7.32	Chalcopyrite	192	8.11.6	Absolute Dating by the ¹⁴⁷ Sm to ¹⁴³ Nd Decay	234
7.33	Apatite	192	8.11.7	Blocking Temperature	234
	Summary	193	8.11.8	Absolute Dating by the Fission-track Method	234
	Review Questions	194		Summary	235
	Further Reading	195		Review Questions	237

8

The Direction and Rate of Natural Processes: An Introduction to Thermodynamics and Kinetics

8.1	Basic Thermodynamic Terms	198
8.2	Heat, Work, and the First Law of Thermodynamics	200
8.3	Entropy and the Second and Third Laws of Thermodynamics	202
8.4	Gibbs Free Energy	203
8.5	Variation of Gibbs Free Energy with Temperature and Pressure	205
8.6	Variation of Gibbs Free Energy with Composition	206
8.7	Thermodynamic Equilibrium	207
8.8	Thermodynamic Phase Diagrams	207
8.9	Multicomponent Phase Diagrams	208
8.9.1	A Simple Two-component System H ₂ O–NaCl	208
8.9.2	Melting of a Pair of Minerals: the Eutectic	210
8.9.3	Congruent Melting and the Granite and Nepheline Syenite Eutectics	214
8.9.4	Incongruent Melting and the Peritectic	214
8.9.5	Melting Relations of Solid Solutions	217
8.9.6	A Simple Ternary Phase Diagram	220
8.9.7	The Ternary Quartz–Albite–Orthoclase “Granite” System	223
8.9.8	A Simple Ternary Basalt System: Diopside–Albite–Anorthite	224
8.9.9	More Complex Phase Diagrams	225

9

How Do Igneous Rocks Form?

9.1	Why, and How, Does Solid Rock Become Molten?	242
9.1.1	Composition of the Upper Mantle	243
9.1.2	Melting Range of Upper Mantle Peridotite	244
9.1.3	Latent Heat of Fusion	245
9.1.4	Geothermal Gradient and the Geotherm	245
9.2	Three Primary Causes of Melting and their Plate Tectonic Settings	245
9.2.1	Raising the Temperature of Mantle Peridotite to the Melting Range over Hot Spots	246
9.2.2	Decompression Melting at Divergent Plate Boundaries	246
9.2.3	Fluxing with Water at Convergent Plate Boundaries (Subduction Zones)	246
9.3	Effect of Pressure on Melting	248
9.3.1	Pressure in the Earth	249
9.3.2	Effect of Pressure on the Anhydrous Melting of Rock	249

9.3.3	Hydrous Melting of Rock and the Solubility of Water in Magma	250	10.2.2	Plutonic Igneous Bodies: Lopoliths, Batholiths, and Stocks	284
9.3.4	Effect of Water Undersaturation on the Melting of Rocks	251	10.2.3	Extrusive Igneous Bodies: Flood Basalts, Shield Volcanoes, Composite Volcanoes, Domes, Calderas, Ash-fall and Ash-flow Deposits	288
9.3.5	Solubility of Other Gases in Magma	251	10.3	International Union of Geological Sciences Classification of Igneous Rocks	301
9.3.6	Exsolution of Magmatic Gases and Explosive Volcanism	251	10.3.1	Mode and Norm	301
9.4	Physical Properties of Magma	256	10.3.2	IUGS Classification of Igneous Rocks	301
9.4.1	Magma Density	256	10.3.3	Composition of Common Plutonic Igneous Rocks	305
9.4.2	Magma Viscosity	256	10.3.4	IUGS Classification of Volcanic Igneous Rocks	308
9.4.3	Diffusion in Magma, Crystal Growth, and Grain Size of Igneous Rocks	258	10.3.5	Irvine–Baragar Classification of Volcanic Rocks	308
9.5	Magma Ascent	260	10.4	Igneous Rocks and their Plate Tectonic Setting	310
9.5.1	Buoyancy	260	10.4.1	Igneous Rocks Formed at Mid-ocean-ridge Divergent Plate Boundaries	310
9.5.2	Buoyant Rise of Magma	261	10.4.2	Igneous Rocks of Oceanic Islands Formed above Hot Spots	313
9.6	Processes Associated with the Solidification of Magma in the Crust	262	10.4.3	Continental Flood Basalts and Large Igneous Provinces	314
9.6.1	Cooling of Bodies of Magma by Heat Conduction	262	10.4.4	Alkaline Igneous Rocks Associated with Continental Rift Valleys	315
9.6.2	Cooling of Bodies of Magma by Convection and Radiation	266	10.4.5	Igneous Rocks Formed near Convergent Plate Boundaries	318
9.6.3	Magmatic Differentiation by Crystal Settling	266	10.5	Special Precambrian Associations	323
9.6.4	Compaction of Crystal Mush	270	10.5.1	Komatiites	324
9.6.5	Assimilation and Fractional Crystallization	270	10.5.2	Massif-type Anorthosites	324
9.6.6	Liquid Immiscibility	271	10.5.3	Rocks Associated with Large Meteorite Impacts	326
9.7	Evolution of Isotopic Reservoirs in the Earth and the Source of Magma	272	Summary		329
9.7.1	Evolution of $^{143}\text{Nd}/^{144}\text{Nd}$ Reservoirs in the Bulk Earth, Mantle, and Crust	272	Review Questions		330
9.7.2	Evolution of $^{87}\text{Sr}/^{86}\text{Sr}$ Reservoirs in the Bulk Earth, Mantle, and Crust	273	Online Resources		331
Summary		274	Further Reading		331

10

Igneous Rocks: Their Mode of Occurrence, Classification, and Plate Tectonic Setting 279

10.1	Why an Igneous Rock Classification Is Necessary	280
10.2	Mode of Occurrence of Igneous Rocks	280
10.2.1	Shallow Intrusive Igneous Bodies: Dikes, Sills, Laccoliths, Cone Sheets, Ring Dikes, and Diatremes	280

11

Sedimentary Rock-forming Minerals and Materials 333

11.1	The Interaction of the Earth's Atmosphere with Minerals	334
11.2	Ice	335
11.3	Goethite	336
11.4	Kaolinite	337
11.5	Calcite	338

11.6	Aragonite	339
11.7	Dolomite	341
11.8	Magnesite	341
11.9	Siderite	343
11.10	Rhodochrosite	343
11.11	Halite	343
11.12	Sylvite	344
11.13	Gypsum	344
11.14	Anhydrite	345
11.15	Chert and agate	346
11.16	Phosphorite	346
11.17	Soil	348
	Summary	350

12

Formation, Transport, and Lithification of Sediment

		353
12.1	Importance of Sediments in Understanding the History of the Earth	354
12.2	Sediment Formed from Weathering of Rock	355
12.2.1	Role of Carbon Dioxide in Weathering	355
12.2.2	Weathering Products of Rock	356
12.2.3	Detrital Grain Size	358
12.2.4	Detrital Grain Roundness and Resistance to Abrasion	358
12.3	Organically Produced Sediment	360
12.3.1	Formation of Carbonate and Siliceous Sediment	360
12.3.2	Formation of Hydrocarbons in Sediment	363
12.4	Chemically Produced Sediment	363
12.5	Sediment Produced by Glacial Erosion	364
12.6	Transport of Sediment	366
12.6.1	Laminar and Turbulent Flow	366
12.6.2	Movement of Particles by Fluid Flow	367
12.6.3	Movement of Particles in Turbidity Currents	370
12.6.4	Movement of Sediment in Debris Flows	371
12.7	Layering in Sediments and Sedimentary Rocks	372
12.7.1	Law of Superposition	372
12.7.2	Milankovitch Cycles	373

12.7.3	Sediments Related to Tectonic Processes	374
12.8	Sites of Deposition and Tectonic Significance	375
12.8.1	Convergent Plate Boundaries	375
12.8.2	Passive Continental Margins	376
12.8.3	Rift and Pull-apart Basins	376
12.9	Conversion of Unconsolidated Sediment to Sedimentary Rock: Lithification	377
12.9.1	Porosity and Compaction	378
12.9.2	Cementation of Sediment	378
12.9.3	Pressure Solution	378
12.9.4	Recrystallization, Replacement, Dolomitization	380
	Summary	380
	Review Questions	381
	Online Resources	382
	Further Reading	383

13

Sedimentary Rock Classification, Occurrence, and Plate Tectonic Significance

		385
13.1	Siliciclastic Sedimentary Rocks	386
13.1.1	Mudrocks (Includes Shales)	386
13.1.2	Sandstones	390
13.1.3	Conglomerates and Breccias	396
13.2	Carbonate Sedimentary Rocks	399
13.2.1	Limestones	399
13.2.2	Dolostones	407
13.2.3	Tectonic Settings of Carbonate Rocks	407
13.3	Coals	408
13.4	Oil and Natural Gas	409
13.5	Evaporites	410
13.6	Phosphorites	410
13.7	Iron-formations	410
	Summary	411

Earth Materials and Human Health	523		
18.1 The Human Body's Need for Earth Materials	524		

Preface

Over the past two decades, many curriculum changes have occurred in geology, Earth science, and environmental science programs in universities. Many of these have involved the compression of separate one-semester courses in mineralogy, optical mineralogy, and petrology into a single-semester offering that combines mineralogy and petrology, commonly called Earth Materials. Such a course is a challenge to the instructor (or a team of instructors) and the students. This is especially so when few, if any, textbooks for such a one-semester course have been available.

This text, *Earth Materials*, is an introduction to mineralogy and petrology in which both subjects are covered with a roughly even balance. To keep this textbook reasonably short and applicable to a one-semester course, we decided against providing a shallow survey of everything and instead concentrated on what we consider the most fundamental aspects of the various subjects.

In the writing of this text, we assumed that the students who enroll in an Earth materials course would have previously taken an introductory physical geology course, as well as a course in college-level chemistry.

Coverage

Basic aspects of mineralogy must precede the coverage of petrology. This sequence is obvious from the chapter headings. After a brief, general introduction in Chapter 1, minerals and rocks are broadly defined in Chapter 2. That is followed by three chapters that relate to various mineralogical aspects and concepts. Chapter 3 covers the identification techniques that students must become familiar with to recognize unknown minerals in the laboratory and in the field. It also includes discussion of two common instrumental techniques: X-ray powder diffraction and electron beam methods. Chapter 4 covers the most fundamental aspects of crystal chemistry, and Chapter 5 is a short introduction to basic aspects of crystallography. Chapter 6 covers optical mineralogy. This subject is included so that instructors who plan to introduce thin sections of rocks in their course can give their students quick access to the fundamentals of optical mineralogy and the optical properties of rock-forming minerals.

The sequencing of subsequent systematic mineralogy chapters is completely different from that most commonly used in mineralogy textbooks. In these chapters, minerals are discussed in groups based first on chemistry (native elements, oxides, silicates, and so on) and, subsequently, for the silicates, on structural features (layer, chain, and framework silicates, and so on). Here, the decision was made to group systematic mineralogy descriptions as part of the three major rock types: igneous, sedimentary, and metamorphic. This allows for the closest possible integration of mineralogy and petrology.

Chapter 7 gives systematic mineralogical data on 29 of the most common igneous minerals, including, in order of decreasing abundance, silicates, oxides, a few sulfides, and a phosphate.

Before discussing igneous, sedimentary, and metamorphic rocks, the second edition of *Earth Materials* has a new Chapter 8 that introduces thermodynamics and kinetics. Thermodynamics provides an explanation for the direction of all geologic processes but the rate at which these goals are achieved depends on kinetic factors. Although both of these subjects can be highly mathematical, this chapter introduces them in easily understood mathematical terms. This chapter also discusses one of the most important kinetic processes in unraveling Earth history, radioactive decay.

Chapter 9 presents the most fundamental aspects of the formation of igneous rocks, explaining why the normally solid Earth can, on occasion, partly melt to form magma, whose physical and chemical properties control its rise toward the surface where it eventually solidifies. A new section added at the end of this chapter discusses how evolving isotopic reservoirs in the Earth can reveal the source of magmas. This is followed by Chapter 10, which addresses the occurrence of igneous rock types, their classification, and plate tectonic settings.

Chapter 11 gives systematic mineralogical descriptions of 14 common sedimentary minerals as well as phosphorite and soil. (The siliciclastic components of sedimentary rocks are discussed in Chapter 7, which deals with igneous minerals). Chapter 12 deals with the formation, transport, and lithification of sediment, and Chapter 13 discusses sedimentary rock classification, as well as the occurrence and plate tectonic setting of sedimentary rocks.

Chapter 14 gives the systematic mineralogy of 27 of the most common metamorphic minerals, all of which are silicates, except for two, an oxide and an element. Chapter 15 addresses the causes of metamorphism, gives rock classifications, and relates their occurrence to plate tectonic settings.

CRYSTALVIEWER

The atomic structure illustrations, which are static images in this text, can also be viewed as interactive visualizations in CrystalViewer, a crystal structures visualization program for Mac and Windows. CrystalViewer is designed to provide the missing “third dimension” for crystal structure illustrations in the book. Each structure can be rotated and scaled with the computer mouse, and it is hoped that such interactive exploration will lead to an improved visual understanding of the complex three-dimensional atomic arrangements of minerals. The program contains 105 structure illustrations, which are distributed over two files. The first file, with the title “Learning,” contains 24 structures that are referenced with figure numbers from Chapters 2, 4, and 5. These 24 structures illustrate basic aspects of crystal chemistry. The other file, entitled “Reference” with 81 crystal structures, is arranged in alphabetical order, by mineral name. This file contains the structures of the rock-forming minerals discussed in Chapters 5, 7, 10, 13, and 15. These structures complement the structure illustrations in the text that show unit cell outlines, space group notation, and legends with atomic site occupancies. The files and the CrystalViewer download are at www.cambridge.org/earthmaterials.

PYROXENE

QUARTZ

Chapter 16 gives systematic mineralogical descriptions of selected minerals that are of economic importance. Chapter 17 gives a brief overview of some selected resources of Earth materials and has a new section on shale gas, its extraction by hydraulic fracturing (fracking), and its potential environmental impact. Chapter 18 discusses the health effects of several minerals and chemical elements, and the hazards presented by certain rock-forming processes.

In the chapters that deal mainly with systematic mineralogy (Chapters 7, 11, 14, and 16), the main emphasis is on geologic occurrence (paragenesis), chemistry and atomic structure, physical properties that are pertinent to hand specimen identification (in laboratory sessions associated with an Earth materials course), and uses in industry and manufacturing. Hand specimen photographs and atomic structure illustrations are given for each mineral discussed.

This text is meant to be not only a supplement to lectures but also a reference source in the applied laboratory sessions of the course. Basic concepts in crystal chemistry, crystallography, and the origin of various rock types are best presented by the instructor in lectures in the classroom. Mineral and rock identification and classification schemes, however, are best learned in the laboratory with hand specimens and thin sections, using those parts of the book that specifically address the applied aspects.

All chapters begin with a boxed overview of what follows and end with a summary and set of review questions. When a new term is first encountered in the text, it is printed in bold type to signify that its definition is included in the glossary at the end of the text.

Our overall goal was the production of an accessible, highly illustrated and visually attractive, condensed and well-integrated mineralogy-petrology textbook suitable for one-semester Earth materials courses. It is our hope that we have succeeded.

Acknowledgments to First Edition

Cornelis Klein thanks Charles Langmuir, Professor in the Department of Earth and Planetary Sciences at Harvard University, for granting him permission (together with a professional photographer, David Nufer, of David Nufer Photography in Albuquerque, New Mexico) to access and photograph specimens from the Harvard Mineralogy Collections. David and I spent three full days there and with the full-time and very attentive help of Carl Francis (curator of the Harvard Mineralogy Museum and Collections) – whose enormous knowledge of the collections allowed us to locate the most appropriate specimens quickly – we completed all of the necessary hand specimen photography of the minerals for this text. Overnight lodging for our four nights in Cambridge, Massachusetts, was generously provided by Leverett House, one of the college houses of which I had been Allston Burr Senior Tutor between 1966 and 1970. We are most grateful to JoAnn DiSalvo Haas and Lauren Brandt for having provided us with some great student rooms.

Throughout the two-year period devoted to the writing of my sections of this text, many colleagues, be it at the University of New Mexico or elsewhere, have been helpful and generous with their time in reviewing sections of text while still in progress. They appear here in alphabetical order: Adrian Brearley, Jonathan Callender, Brian Davis, Amy Ellwein, Maya Elrick, Dave Gutzler, Rhian Jones, Bruce Loeffler, Matt Nyman, Frans Rietmeijer, Malcolm Ross, Jane Selverstone, and Mary Simmons.

I am grateful to David Palmer of CrystalMaker Software Limited, Yarnton, Oxfordshire, England, for providing expertise and guidance in the design of the crystal structure visualization program that accompanies this textbook.

This book would not have been possible without the support and patient understanding of my wife, Shirley Morrison. The word processing of my part of this text was most efficiently and enthusiastically accomplished by Mabel Chavez of Santo Domingo Pueblo, New Mexico.

Anthony R. Philpotts would like to thank the many reviewers who have painstakingly struggled through what we have written and suggested improvements. We have tried to incorporate as many of these as possible within the limits set by the length of the book. I would particularly like to thank Grant Cawthorn for one of the most thorough reviews I have ever received. His knowledge of igneous rocks and the photographs he provided have greatly benefited the book. Dan Kontak, Tony Morse, Brian Robins, and Jane Selverstone also offered valuable advice, as did numerous anonymous reviewers. I am grateful to all of them.

While writing this book, I have greatly appreciated interactions with many colleagues. Jay Ague, Brian Skinner, and Leo Hickey at Yale University, and Sheila Seaman, Mike Rhodes, and Tony Morse at the University of Massachusetts have all provided me with geological insights. I have also learned a considerable amount about sedimentary rocks from Randy Steinen, formerly of the University of Connecticut, and Paul Olsen, of the Lamont-Dougherty Earth Observatory of Columbia University.

I am grateful to the many petrology students I have had over the years. Their many questions and interests played a big role in how I taught the courses and in no small way have determined what, and how, petrology is presented in this book.

Last, none of my part of this book would have been possible without the support of my wife, who allowed me to disappear into my study for fully two years. She is owed an enormous debt of gratitude, especially in view of the fact that when I finished revising my previous book (*Principles of Igneous and Metamorphic Petrology*), I promised her that it was definitely the last one!

Acknowledgments to Second Edition

Anthony Philpotts wants to express his gratitude for having had the opportunity to work with Kase Klein on both the first and second editions of *Earth Materials*. On June 1, 2016, Kase suddenly, and unexpectedly, passed away. With his passing, the academic world lost one of the great teachers of mineralogy, but I also lost a very dear friend. We were undergraduates together at McGill University in Montreal, taking the same mineralogy and petrology courses and doing all the things that undergraduates typically do. It seemed only natural that toward the end of our careers we should come back together and pool our efforts in writing a book that introduces what we believed were the essentials of mineralogy and petrology that could be covered in the one-semester courses in Earth materials that have recently become so common. Given the vast scope of mineralogy and petrology, deciding on what should be included, or excluded, was a huge task, and I am so grateful to have had the benefit of Kase's wise council. Fortunately, all revisions for the second edition were completed before his untimely death. This book therefore contains his final contribution to the teaching of mineralogy. From its pages, readers will hopefully glean some of Kase's enthusiasm for mineralogy, and with this introduction possibly go on to delve deeper into the subject, as Kase would have hoped.
