

Contents

<i>Guiding signs</i>	<i>page</i> viii
<i>Preface</i>	ix
<i>Acknowledgements</i>	xi
1 Weather Prediction by Numerical Process	1
1.1 The problem	1
1.2 Vilhelm Bjerknes and scientific forecasting	4
1.3 Outline of Richardson's life and work	10
1.4 The origin of <i>Weather Prediction by Numerical Process</i>	14
1.5 Outline of the contents of <i>WPNP</i>	18
1.6 Preview of remaining chapters	25
2 The fundamental equations	29
2.1 Richardson's general circulation model	30
2.2 The basic equations	31
2.3 The vertical velocity equation	39
2.4 Temperature in the stratosphere	42
2.5 Pressure co-ordinates	44
3 The oscillations of the atmosphere	47
3.1 The Laplace tidal equations	48
3.2 Normal modes of the atmosphere	49
3.3 Atmospheric tides	55
3.4 Numerical solution of the Laplace tidal equations	56
4 The barotropic forecast	63
4.1 Richardson's model and data	63
4.2 The finite difference scheme	65

vi	<i>Contents</i>	
4.3	Richardson's conclusions	68
4.4	The global numerical model	70
4.5	Extending the forecast	72
4.6	Non-divergent and balanced initial conditions	75
4.7	Reflections on the single layer model	77
5	The solution algorithm	79
5.1	The finite difference method	79
5.2	Integration in time	81
5.3	The Courant–Friedrichs–Lewy stability criterion	85
5.4	The Richardson grid	87
5.5	The equations for the strata	89
5.6	The computational algorithm	92
6	Observations and initial fields	97
6.1	Aerological observations	97
6.2	Dines' meteorograph	100
6.3	The Leipzig charts	104
6.4	Preparation of the initial fields	109
7	Richardson's forecast	117
7.1	What Richardson actually predicted: 20 numbers	117
7.2	Scaling the equations of motion	120
7.3	Analysis of the initial tendencies	125
7.4	The causes of the forecast failure	131
7.5	Max Margules and the 'impossibility' of forecasting	133
8	Balance and initialisation	137
8.1	Balance in the atmosphere	137
8.2	The slow manifold	140
8.3	Techniques of initialisation	142
8.4	The swinging spring	146
8.5	Digital filter initialisation	152
9	Smoothing the forecast	159
9.1	Reconstruction of the forecast	159
9.2	Richardson's five smoothing methods	162
9.3	Digital filtering of the initial data	164
9.4	Extension of the forecast	175

Cambridge University Press

978-1-107-41483-9 - The Emergence of Numerical Weather Prediction: Richardson's Dream

Peter Lynch

Table of Contents

[More information](#)

	<i>Contents</i>	vii
10	The ENIAC integrations	181
10.1	The 'Meteorology Project'	182
10.2	The filtered equations	187
10.3	The first computer forecast	190
10.4	The barotropic model	196
10.5	Multi-level models	199
10.6	Primitive equation models	202
10.7	General circulation models and climate modelling	206
11	Numerical weather prediction today	209
11.1	Observational data	209
11.2	Objective analysis	213
11.3	Progress in computing	219
11.4	The European Centre for Medium-Range Weather Forecasts	221
11.5	Meso-scale modelling	228
11.6	Chaos, predictability and ensemble forecasting	231
12	Fulfilment of the dream	243
12.1	Richardson's explanation of his <i>glaring error</i>	243
12.2	The 'forecast factory'	246
12.3	Richardson's dream	248
Appendix 1	Table of notation	251
Appendix 2	Milestones in Richardson's life and career	254
Appendix 3	Laplace tidal equations: separation of variables	256
Appendix 4	Richardson's forecast factory: the \$64 000 question	259
	<i>References</i>	262
	<i>Index</i>	274
