I. THE ECONOMIC MAN AND A WORLD AT WAR.

Current opinion since the outbreak of war often speaks of the "violation of economic laws": the opposition between the conceptions of the "economic man" and of "economic chivalry": the ultimate unity of patriotic and economic motives during war time: limitations and extensions of the liberty of the individual during hostilities: the State becomes the temporary trustee of the freedom of action which the citizen relinquishes for the time: therefore it is desirable that no sound part of the organisation of peace time should be scrapped, while, conversely, the upheaval of war affords opportunities of removing functions of the industrial and social organism which had survived their period of usefulness: industry of the new peace will be less sordid and more efficient: the probable increase of invention and other improvements: the experience of this after the Napoleonic wars: the fullest fruits of peace will only be obtained through the reviving of the nation in greater harmony at home and amity amongst the nations . . . p. 1

II. "FOR THE DURATION OF THE WAR."

Emergency measures presuppose a static conception of industry: the arresting of some social function does not mean that it can be isolated so as to resume its previous activity when the war has ended: during the period of suspension the process of adaptation to environment continues, and it is not improbable that the suspended function will be released in circumstances which will be greatly changed: the magnitude of hostilities is some measure of the diversion of labour which has been necessary—Adam Smith on the proportion of the population which can be supported as soldiers, Coleridge on overseas commerce in time of war: the mode and some of the consequences of transfer of labour since 1914: mobilisation of industry intended to be for the duration of the war: how far the experience of previous wars is valuable: the scope and limitations of the historical method: the verdict of historians of the future on the extent of voluntary effort since 1914: Mazzini on national regeneration through sacrifice: compulsion and the

range of State activity after the war—J. S. Mill's prophecy: effect of national animosity upon trade after the war: German peaceful penetration: war economics dominated by the short period, post-bellum economics by the long period: economic collaboration of Great Britain with the Dominions and the Allies: the "golden dream" of Adam Smith: its economic and political aspects—Jevons on the function of the statesman. . . . p. 21

III. COMMUNICATIONS OF A MARITIME STATE.

Kant's prophecy that barbarous methods of warfare would result in a war of extermination: German submarine methods and the "custom of the sea": losses of shipping in war: the experience of the Napoleonic wars: Great Britain lost from 1803 to 1814 at least 40 per cent. of her shipping and the position was only saved by new construction: the experience of the present gives rise to serious considerations regarding the future: the essential differences between the maritime and the land State: the protection of the ocean routes connecting the parts of Greater Britain is a vital problem: the view of Adam Smith: the development of inter-Imperial communication: the nationality and status of seamen in British ships: one of Germany's greatest errors has been the violation of the "custom of the sea": great seamen on the high purpose of their calling—Camões, Sir Walter Raleigh, Nelson's admirals: future problems of the defence of communications: the extension of warfare to a third dimension: the relative advantages and disadvantages of ocean routes and land routes in the future: the problem of inter-Imperial communication, which, in principle, conforms to the conditions of a coating trade: the ideal of maximum liberty in relation to adequate security . . p. 41

IV. THE SURPRISES OF PEACE.

The surprises of war and of industry during war: the faculty of anticipating the future: difficulty in forming forecasts in war: the effect of a sudden declaration of hostilities—Sir F. Baring on the outbreak of war in 1793: during the first two years of the present war forecasts may be described as having been "sub-normal": the exceptional difficulties of anticipating the state of commerce and industry during the early years of peace—Dr Venn on the chaotic basis of conviction: forecasts, however, were being made in 1916: the danger of a rebound from comparative pessimism to undue optimism: the danger of applying old principles (which may have become little more than catchwords) to new conditions: the opposite evil of regarding post-war conditions as divorced from those of the previous peace: the need to recognise both continuity and new phenomena: immaterial conditions are relatively more predictable than material ones: the awakening of the nation from the comparative lethargy of the latter part of the nineteenth century: Emerson's view of the reserve of strength in the English
Contents xi

character: the effect of the aroused national spirit on invention: the reaction of the quickened national apprehension in the making of too many changes: the risks of commercial disorganisation after peace: two possible danger-points which might result in crises followed by long-continued depression: the possibility of protracted labour disputes: the hope that there may be not only political peace but also labour-peace . . . . . . p. 59

V. SAVING AND THE STANDARD OF LIFE.

During war the State may demand the wealth as well as the services of its subjects: the reason it borrows a part of the sums required for war-expenditure: sales of investments abroad: the danger of the latter: the conduct of war demands economy: this may be enforced by taxation or be voluntary when the resources saved are lent to the Government: the conditions and effects of saving: by the force of habit systems of desires had become fixed and rigid, so that there were large parts of personal expenditure determined by a conventional standard: the needs of the time and the general upheaval of war have tended to cause a breaking up of the former systems of desire: the revolution in standards of living: in so far as economy has been adopted, voluntarily or enforced, new habits of expenditure are being formed, and these may tend to persist: the need for greater saving, even when the war is ended, in order to hasten industrial recuperation by providing the necessary capital p. 81

VI. ORGANISATION RE-ORIENTATED.

Future generations of economists will no doubt criticise the analyses and theories of the present day, as it is necessary for present-day writers to do with those of the past: the implications of terminologies: the conception of organisation: changes in the naming of industrial phenomena: the element of metaphor and theory involved in the idea of the industrial organism: the influence of Evolution: organising of industry and also of labour: organising of other factors of Production: the State and industry: industrial organisation first a Productive category, possibly tending now to be rather a Distributive one: internal resistance in the industrial organism: industry conceived apart from the biological implications of Evolution: the framing of a scheme of Production: the incomplete co-operation of the human agents in Production: the future influence of the State in relation to individual initiative: the psychological aspect of the relation of individuals to the State. Industry to be conceived less as an evolutionary process than as a problem, namely the attaining of a harmonious relation between the human agents concerned in each individual act of Production: the larger part of the practical steps in the future will be the recognition of the problem as to the need for a less imperfect co-operation of the various factors of Production . . . . . . p. 99
